modifier description\n   * ^/\n    offset: 0\n  },\n  /**\n   * Modifier used to prevent the popper from being
positioned outside the boundary.\n   *\n   * A scenario exists where the reference itself is not within the
boundaries.<br />\n   * We can say it has `escaped the boundaries` — or just `escaped`.<br />\n   * In this case
we need to decide whether the popper should either:\n   *\n   * - detach from the reference and remain `trapped` in
the boundaries, or\n   * - if it should ignore the boundary and `escape with its reference`\n   *\n   * When

```

`escapeWithReference` is set to `true` and reference is completely outside its boundaries, the popper will overflow (or completely leave) the boundaries in order to remain attached to the edge of the reference.

@memberof modifiers
@inner
`preventOverflow`: {
 `order`: 300 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: preventOverflow,
 `priority`: ['left', 'right', 'top', 'bottom']
 `padding`: 5 - Amount of pixel used to define a minimum distance between the boundaries and the popper. This makes sure the popper always has a little padding between the edges of its container
 `boundariesElement`: 'scrollParent' - Boundaries used by the modifier. Can be `scrollParent`, `window`, `viewport` or any DOM element.
 `boundariesElement`: 'scrollParent',
 `modifier`:
 `keepTogether`: {
 `order`: 400 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: keepTogether
 }
 `arrow`: {
 `order`: 500 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: arrow,
 `element`: '[x-arrow]' - Selector or node used as arrow
 `flip`: {
 `order`: 600 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: flip,
 `behavior`: 'flip' - The behavior used to change the popper's placement. It can be one of `flip`, `clockwise`, `counterclockwise` or an array with a list of valid placements (with optional variations)
 `padding`: 5 - The popper will flip if it hits the edges of the `boundariesElement`
 `boundariesElement`: 'viewport' - The element which will define the boundaries of the popper position.
 `inner`: {
 `order`: 700 - Index used to define the order of execution
 `enabled`: false - Whether the modifier is enabled or not
 `fn`: inner
 }
 `hide`: {
 `order`: 800 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: hide
 }
 }

Popper will try to prevent overflow following these priorities by default, then, it could overflow on the left and on top of the `boundariesElement` priority: ['left', 'right', 'top', 'bottom'],

Amount of pixel used to define a minimum distance between the boundaries and the popper. This makes sure the popper always has a little padding between the edges of its container

Boundaries used by the modifier. Can be `scrollParent`, `window`, `viewport` or any DOM element.

Modifier used to make sure the reference and its popper stay near each other without leaving any gap between the two. Especially useful when the arrow is enabled and you want to ensure that it points to its reference element. It cares only about the first axis. You can still have poppers with margin between the popper and its reference element.

@memberof modifiers
@inner
`keepTogether`: {
 `order`: 400 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: keepTogether
 }
 This modifier is used to move the `arrowElement` of the popper to make sure it is positioned between the reference element and its popper element. It will read the outer size of the `arrowElement` node to detect how many pixels of conjunction are needed. It has no effect if no `arrowElement` is provided.

@memberof modifiers
@inner
`arrow`: {
 `order`: 500 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: arrow,
 `element`: '[x-arrow]' - Selector or node used as arrow
 `flip`: {
 `order`: 600 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: flip,
 `behavior`: 'flip' - The behavior used to change the popper's placement. It can be one of `flip`, `clockwise`, `counterclockwise` or an array with a list of valid placements (with optional variations)
 `padding`: 5 - The popper will flip if it hits the edges of the `boundariesElement`
 `boundariesElement`: 'viewport' - The element which will define the boundaries of the popper position.
 `inner`: {
 `order`: 700 - Index used to define the order of execution
 `enabled`: false - Whether the modifier is enabled or not
 `fn`: inner
 }
 `hide`: {
 `order`: 800 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: hide
 }
 }

Modifier used to flip the popper's placement when it starts to overlap its reference element. Requires the `preventOverflow` modifier before it in order to work.

NOTE: this modifier will interrupt the current update cycle and will restart it if it detects the need to flip the placement.

@memberof modifiers
@inner
`flip`: {
 `order`: 600 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: flip,
 `behavior`: 'flip' - The behavior used to change the popper's placement. It can be one of `flip`, `clockwise`, `counterclockwise` or an array with a list of valid placements (with optional variations)
 `padding`: 5 - The popper will flip if it hits the edges of the `boundariesElement`
 `boundariesElement`: 'viewport' - The element which will define the boundaries of the popper position.
 `inner`: {
 `order`: 700 - Index used to define the order of execution
 `enabled`: false - Whether the modifier is enabled or not
 `fn`: inner
 }
 `hide`: {
 `order`: 800 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: hide
 }

The popper will flip if it hits the edges of the `boundariesElement`

The element which will define the boundaries of the popper position. The popper will never be placed outside of the defined boundaries (except if `keepTogether` is enabled)

Boundaries used by the modifier. Can be `scrollParent`, `window`, `viewport` or any DOM element.

Modifier used to make the popper flow toward the inner of the reference element. By default, when this modifier is disabled, the popper will be placed outside the reference element.

@memberof modifiers
@inner
`inner`: {
 `order`: 700 - Index used to define the order of execution
 `enabled`: false - Whether the modifier is enabled or not
 `fn`: inner
 }
 Modifier used to hide the popper when its reference element is outside of the popper boundaries. It will set a `x-out-of-boundaries` attribute which can be used to hide with a CSS selector the popper when its reference is out of boundaries.

Requires the `preventOverflow` modifier before it in order to work.

@memberof modifiers
@inner
`hide`: {
 `order`: 800 - Index used to define the order of execution
 `enabled`: true - Whether the modifier is enabled or not
 `fn`: hide
 }
 Computes the style that will be applied to the popper element to get properly

positioned.

Note that this modifier will not touch the DOM, it just prepares the styles so that `applyStyle` modifier can apply it. This separation is useful in case you need to replace `applyStyle` with a custom implementation.

This modifier has `850` as `order` value to maintain backward compatibility with previous versions of Popper.js. Expect the modifiers ordering method to change in future major versions of the library.

`@memberof modifiers`

`@inner`

```
computeStyle: {
  /** @prop {number} order=850 - Index used to define the order of execution
  * @prop {Boolean} enabled=true - Whether the modifier is enabled or not
  * @prop {ModifierFn} fn: computeStyle,
  * @prop {Boolean} gpuAcceleration=true
  * If true, it uses the CSS 3D transformation to position the popper.
  * Otherwise, it will use the `top` and `left` properties
  * @prop {string} [x='bottom'] - Where to anchor the X axis ('bottom' or 'top'). AKA X offset origin.
  * Change this if your popper should grow in a direction different from `bottom`
  * @prop {string} [x='left'] - Where to anchor the Y axis ('left' or 'right'). AKA Y offset origin.
  * Change this if your popper should grow in a direction different from `right`
  * @prop {Function} onLoad: applyStyleOnLoad,
  * Applies the computed styles to the popper element.
  * All the DOM manipulations are limited to this modifier. This is useful in case you want to integrate Popper.js inside a framework or view library and you want to delegate all the DOM manipulations to it.
  * Note that if you disable this modifier, you must make sure the popper element has its position set to `absolute` before Popper.js can do its work!
  * Just disable this modifier and define your own to achieve the desired effect.
  * @prop {number} order=900 - Index used to define the order of execution
  * @prop {Boolean} enabled=true - Whether the modifier is enabled or not
  * @prop {ModifierFn} fn: applyStyle,
  * @prop {Function} onLoad: applyStyleOnLoad,
  * @deprecated since version 1.10.0, the property moved to `computeStyle` modifier
  * @prop {Boolean} gpuAcceleration=true
  * If true, it uses the CSS 3D transformation to position the popper.
  * Otherwise, it will use the `top` and `left` properties
  * @prop {Object} data: {}
  * The `dataObject` is an object containing all the information used by Popper.js.
  * This object is passed to modifiers and to the `onCreate` and `onUpdate` callbacks.
  * @property {Object} data.instance The Popper.js instance
  * @property {String} data.placement Placement applied to popper
  * @property {String} data.originalPlacement Placement originally defined on init
  * @property {Boolean} data.flipped True if popper has been flipped by flip modifier
  * @property {Boolean} data.hide True if the reference element is out of boundaries, useful to know when to hide the popper
  * @property {HTMLElement} data.arrowElement Node used as arrow by arrow modifier
  * @property {Object} data.styles Any CSS property defined here will be applied to the popper. It expects the JavaScript nomenclature (eg. `marginBottom`)
  * @property {Object} data.arrowStyles Any CSS property defined here will be applied to the popper arrow. It expects the JavaScript nomenclature (eg. `marginBottom`)
  * @property {Object} data.boundaries Offsets of the popper boundaries
  * @property {Object} data.offsets The measurements of popper, reference and arrow elements
  * @property {Object} data.offsets.popper `top`, `left`, `width`, `height` values
  * @property {Object} data.offsets.reference `top`, `left`, `width`, `height` values
  * @property {Object} data.offsets.arrow] `top` and `left` offsets, only one of them will be different from 0
  * Default options provided to Popper.js constructor.
  * These can be overridden using the `options` argument of Popper.js.
  * To override an option, simply pass an object with the same structure of the `options` object, as the 3rd argument. For example:
  * new Popper(ref, pop, {
  *   modifiers: {
  *     preventOverflow: { enabled: false }
  *   }
  * })
  * @type {Object}
  * @static
  * @memberof Popper
  * @nvar Defaults = {
  *   Popper's placement
  *   @prop {Popper.placements} placement='bottom'
  *   @prop {Boolean} positionFixed=false
  *   @prop {Boolean} positionFixed: false,
  *   Whether events (resize, scroll) are initially enabled.
  *   @prop {Boolean} eventsEnabled=true
  *   @prop {Boolean} eventsEnabled: true,
  *   Set to true if you want to automatically remove the popper when you call the `destroy` method.
  *   @prop {Boolean} removeOnDestroy=false
  *   @prop {Boolean} removeOnDestroy: false,
  *   Callback called when the popper is created.
  *   By default, it is set to no-op.
  *   Access Popper.js instance with `data.instance`

}
}
return a ? 1 : -1;
}

Returns a function to use in pseudos for input types
@param {String} type
function createInputPseudo( type ) {
return function( elem ) {
var name = elem.nodeName.toLowerCase();
return name === "input" && elem.type === type;
};
}

Returns a function to use in pseudos for buttons
@param {String} type
function createButtonPseudo( type ) {
return function( elem ) {
var name = elem.nodeName.toLowerCase();
return ( name === "input" || name === "button" ) && elem.type === type;
};
}

Returns a function to use in pseudos for :enabled/:disabled
@param {Boolean} disabled
true for :disabled; false for :enabled
function createDisabledPseudo( disabled ) {
Known :disabled false
positives: fieldset[disabled] > legend:nth-of-type(n+2) :can-disable
return function( elem ) {
Only certain elements can match :enabled or :disabled
https://html.spec.whatwg.org/multipage/scripting.html#selector-enabled
https://html.spec.whatwg.org/multipage/scripting.html#selector-disabled
if ( "form" in elem ) {
Check for inherited disabledness on relevant non-disabled elements:
* listed form-associated elements in a disabled fieldset
https://html.spec.whatwg.org/multipage/forms.html#category-listed
https://html.spec.whatwg.org/multipage/forms.html#concept-fe-disabled
* option elements in a disabled optgroup
https://html.spec.whatwg.org/multipage/forms.html#concept-option-disabled
All such elements have a "form" property.
if ( elem.parentNode && elem.disabled === false ) {
Option elements defer to a parent optgroup if present
if ( "label" in elem ) {
if ( "label" in elem.parentNode ) {
return elem.parentNode.disabled === disabled;
} else {
return elem.disabled === disabled;
}
}
Support: IE 6 - 11
Use the isDisabled shortcut property to check for disabled fieldset ancestors
return elem.isDisabled === disabled ||
Where there is no isDisabled, check manually
jshint -W018
elem.isDisabled !== !disabled &&
elem.disabledAncestor( elem ) === disabled;
return elem.disabled === disabled;
}
Try to winnow out elements that can't be disabled before trusting the disabled property.
Some victims get caught in our net (label, legend, menu, track), but it shouldn't even exist on them, let alone have a boolean value.
else if ( "label" in elem ) {
return elem.disabled === disabled;
}
Remaining elements are neither :enabled nor :disabled
return false;
};
}

Returns a function to use in pseudos for positionals
@param {Function} fn
function createPositionalPseudo( fn ) {
return markFunction(function( argument ) {
return markFunction(function( seed, matches ) {
var j, matchIndexes = fn( [], seed.length, argument ),
ti = matchIndexes.length;
Match elements found at the specified indexes
while ( i-- ) {
if ( seed[ j = matchIndexes[i] ] ) {
seed[j] = !(matches[j] = seed[j]);
}
}
}
}

Checks a node for validity as a Sizzle context
@param {Element|Object=} context
@returns {Element|Object|Boolean} The input node if acceptable, otherwise a falsy value
function testContext( context ) {
return context && typeof context.getElementsByTagName !== "undefined" && context;
}

Expose support vars for convenience
support = Sizzle.support = {};

Detects XML nodes
@param {Element|Object} elem An element or a document
@returns {Boolean} True iff elem is a non-HTML XML node
Sizzle.isXML = function( elem ) {
documentElement is verified for cases where it doesn't yet exist
(such as loading iframes in IE - #4833)
var documentElement = elem && (elem.ownerDocument || elem).documentElement;
return documentElement ? documentElement.nodeName !== "HTML" : false;
};

Sets document-related variables once based on the current document
@param {Element|Object} [doc] An element or document object to use to set the document
@returns {Object} Returns the current document
function setDocument = Sizzle.setDocument = function( node ) {

0;
}
for ( ; i < 4; i += 2 ) {
Both box models exclude margin
if ( box === "margin" )
{
delta += jQuery.css( elem, box + cssExpand[ i ], true, styles );
}
If we get here with a content-
box, we're seeking "padding" or "border" or "margin"
if ( !isBorderBox ) {
Add
padding
delta += jQuery.css( elem, "padding" + cssExpand[ i ], true, styles );
For "border" or
"margin", add border
if ( box === "padding" ) {
delta += jQuery.css( elem, "border" + cssExpand[ i
] + "Width", true, styles );
}
But still keep track of it otherwise
else {
delta += jQuery.css(
elem, "border" + cssExpand[ i ] + "Width", true, styles );
}
If we get here with a border-box (content
+ padding + border), we're seeking "content" or "padding" or "margin"
else {
For
"content", subtract padding
if ( box === "content" ) {
delta -= jQuery.css( elem, "padding" +
cssExpand[ i ], true, styles );
}
For "content" or "padding", subtract border
if ( box !==
"margin" ) {
delta -= jQuery.css( elem, "border" + cssExpand[ i ] + "Width", true, styles
);
}
}
Account for positive content-box scroll gutter when requested by providing
computedVal
if ( !isBorderBox && computedVal >= 0 ) {
offsetWidth/offsetHeight is a rounded sum of
content, padding, scroll gutter, and border
Assuming integer scroll gutter, subtract the rest and round
down
delta += Math.max( 0, Math.ceil( elem[ "offset" + dimension[ 0 ].toUpperCase() + dimension.slice(
1 ) ] - computedVal - delta - extra - 0.5 ) );
}
return delta;
}
function
getWidthOrHeight( elem, dimension, extra ) {
Start with computed style
var styles = getStyles( elem
),
val = curCSS( elem, dimension, styles ),
isBorderBox = jQuery.css( elem, "boxSizing", false, styles )
=== "border-box",
valueIsBorderBox = isBorderBox;
Support: Firefox <=54
Return a confounding
non-pixel value or feign ignorance, as appropriate.
if ( !numnonpx.test( val ) ) {
if ( !extra ) {
return
val;
}
Check for style in case a browser which returns unreliable values
for
getComputedStyle silently falls back to the reliable elem.style
valueIsBorderBox = valueIsBorderBox && !support.boxSizingReliable() || val === elem.style[ dimension ] );
Fall back to offsetWidth/offsetHeight when
value is "auto"
This happens for inline elements with no explicit setting (gh-3571)
Support: Android
<=4.1 - 4.3 only
Also use offsetWidth/offsetHeight for misreported inline dimensions (gh-3602)
if ( val ===
"auto" || !parseFloat( val ) && jQuery.css( elem, "display", false, styles ) === "inline" ) {
val = elem[
"offset" + dimension[ 0 ].toUpperCase() + dimension.slice( 1 ) ];
offsetWidth/offsetHeight provide border-

2257)
owner[ this.expando ] && owner[ this.expando ][ camelCase( key ) ];
access: function( owner, key, value ) {
  In cases where either:
  1. No key was specified
  2. A string key was specified, but no value provided
  Take the "read" path and allow the get method to determine which value to return, respectively either:
  1. The entire cache object
  2. The data stored at the key
  if ( key === undefined || ( key && typeof key === "string" ) && value === undefined ) {
    return this.get( owner, key );
  }
  When the key is not a string, or both a key and value are specified, set or extend (existing objects) with either:
  1. An object of properties
  2. A key and value
  this.set( owner, key, value );
  Since the "set" path can have two possible entry points
  return the expected data based on which path was taken[*]
  return value !== undefined ? value : key;
}
remove: function( owner, key ) {
  var i, cache = owner[ this.expando ];
  if ( cache === undefined ) {
    return;
  }
  if ( key !== undefined ) {
    Support array or space separated string of keys
    if ( Array.isArray( key ) ) {
      If key is an array of keys...
      We always set camelCase keys, so remove that.
      key = key.map( camelCase );
    } else {
      key = camelCase( key );
    }
    If a key with the spaces exists, use it.
    Otherwise, create an array by matching non-whitespace
    key = key in cache ? [ key ] : key.match( /\w+/g );
  }
  while ( i-- ) {
    delete cache[ key[ i ] ];
  }
  Remove the expando if there's no more data
  if ( key === undefined || jQuery.isEmptyObject( cache ) ) {
    Support: Chrome <=35 - 45
    Webkit & Blink performance suffers when deleting properties
    from DOM nodes, so set to undefined instead
    https://bugs.chromium.org/p/chromium/issues/detail?id=378607 (bug restricted)
    if ( owner.nodeType ) {
      owner[ this.expando ] = undefined;
    } else {
      delete owner[ this.expando ];
    }
  }
}
hasData: function( owner ) {
  var cache = owner[ this.expando ];
  return cache !== undefined && !jQuery.isEmptyObject( cache );
}
var dataPriv = new Data();
var dataUser = new Data();
Implementation Summary
1. Enforce API surface and semantic compatibility with 1.9.x branch
2. Improve the module's maintainability by reducing the storage paths to a single mechanism.
3. Use the same single mechanism to support "private" and "user" data.
4. _Never_ expose "private" data to user code (TODO: Drop _data, _removeData)
5. Avoid exposing implementation details on user objects (eg. expando properties)
6. Provide a clear path for implementation upgrade to WeakMap in 2014
