Core\n
 =====\n
 * This plugin resolves the JSON pointers.\n
 * A major part of this plugin deals with cyclic references via 2 mechanisms.\n
 * 1. If a pointer was already resolved before in this path, halt.\n
 * 2. If the patch value points to one of the ancestors in this path, halt.\n
 * Note that either one of these mechanism is sufficient, both must be in place.\n
 * For examples:\n
 * Given the following spec, #1 alone is insufficient because after the 2nd application, there will be a cyclic object reference.\n
 * a.b.c: \$ref-d\n
 * d.e.f: \$ref-a (per #1, safe to return patch as no immediate cycle)\n
 * Given the following spec, #2 alone is insufficient because although there will never be any cyclic object reference, the plugin will keep producing

```

THE SOFTWARE.\n\n// a transform stream is a readable/writable stream where you do\n// something with the data.
Sometimes it's called a "filter",\n// but that's not a great name for it, since that implies a thing where\n// some bits
pass through, and others are simply ignored. (That would\n// be a valid example of a transform, of course.)\n\n// While the output is causally related to the input, it's not a\n// necessarily symmetric or synchronous transformation.
For example,\n// a zlib stream might take multiple plain-text writes(), and then\n// emit a single compressed chunk
some time in the future.\n\n// Here's how this works:\n\n// The Transform stream has all the aspects of the
readable and writable\n// stream classes. When you write(chunk), that calls _write(chunk,cb)\n// internally, and
returns false if there's a lot of pending writes\n// buffered up. When you call read(), that calls _read(n) until\n//
there's enough pending readable data buffered up.\n\n// In a transform stream, the written data is placed in a buffer.
When\n// _read(n) is called, it transforms the queued up data, calling the\n// buffered _write cb's as it consumes
chunks. If consuming a single\n// written chunk would result in multiple output chunks, then the first\n// outputted
bit calls the readcb, and subsequent chunks just go into\n// the read buffer, and will cause it to emit 'readable' if
necessary.\n\n// This way, back-pressure is actually determined by the reading side,\n// since _read has to be called
to start processing a new chunk. However,\n// a pathological inflate type of transform can cause excessive
buffering\n// here. For example, imagine a stream where every byte of input is\n// interpreted as an integer from 0-
255, and then results in that many\n// bytes of output. Writing the 4 bytes {ff,ff,ff,ff} would result in\n// 1kb of data
being output. In this case, you could write a very small\n// amount of input, and end up with a very large amount of
output. In\n// such a pathological inflating mechanism, there'd be no way to tell\n// the system to stop doing the
transform. A single 4MB write could\n// cause the system to run out of memory.\n\n// However, even in such a
pathological case, only a single written chunk\n// would be consumed, and then the rest would wait (un-transformed)
until\n// the results of the previous transformed chunk were consumed.\n\n'use strict';\n\nmodule.exports =

other `lodash` methods. */\nvar nativeMax = Math.max,\n  nativeMin = Math.min;\n\n/**\n * Creates a debounced function that delays invoking `func` until after `wait` \n * milliseconds have elapsed since the last time the
debounced function was \n * invoked. The debounced function comes with a `cancel` method to cancel \n * delayed
`func` invocations and a `flush` method to immediately invoke them. \n * Provide `options` to indicate whether
`func` should be invoked on the \n * leading and/or trailing edge of the `wait` timeout. The `func` is invoked \n * with
the last arguments provided to the debounced function. Subsequent \n * calls to the debounced function return the
result of the last `func` \n * invocation. \n * \n * **Note:** If `leading` and `trailing` options are `true`, `func` is \n *
invoked on the trailing edge of the timeout only if the debounced function \n * is invoked more than once during the
`wait` timeout. \n * \n * If `wait` is `0` and `leading` is `false`, `func` invocation is deferred \n * until to the next tick,
similar to `setTimeout` with a timeout of `0`. \n * \n * See [David Corbacho's article](https://css-
tricks.com/debouncing-throttling-explained-examples/) \n * for details over the differences between `_debounce`
and `_throttle`. \n * \n * @static \n * @memberOf _ \n * @since 0.1.0 \n * @category Function \n * @param
{Function} func The function to debounce. \n * @param {number} [wait=0] The number of milliseconds to delay. \n *
@param {Object} [options={}] The options object. \n * @param {boolean} [options.leading=false] \n * Specify
invoking on the leading edge of the timeout. \n * @param {number} [options.maxWait] \n * The maximum time
`func` is allowed to be delayed before it's invoked. \n * @param {boolean} [options.trailing=true] \n * Specify
invoking on the trailing edge of the timeout. \n * @returns {Function} Returns the new debounced function. \n *
@example \n * \n * // Avoid costly calculations while the window size is in flux. \n * jQuery(window).on('resize',
_.debounce(calculateLayout, 150)); \n * \n * // Invoke `sendMail` when clicked, debouncing subsequent calls. \n *
jQuery(element).on('click', _.debounce(sendMail, 300, {\n *   'leading': true, \n *   'trailing': false \n * })); \n * \n * //
Ensure `batchLog` is invoked once after 1 second of debounced calls. \n * var debounced = _.debounce(batchLog,
250, {\n *   'maxWait': 1000 }); \n * var source = new EventSource('/stream'); \n * jQuery(source).on('message',

Why would we need to do that? In the future a more dynamic engine will allow certain matches to be ignored. An example: if we matched say the 3rd regex in a large group but decided to ignore it - we'd need to start testing again at the 4th regex... but MultiRegex itself gives us no real

```

way to do that. So what this class creates MultiRegexs on the fly for whatever search position they are needed. NOTE: These additional MultiRegex objects are created dynamically. For most grammars most of the time we will never actually need anything more than the first MultiRegex - so this shouldn't have too much overhead. Say this is our search group, and we match regex3, but wish to ignore it. regex1 | regex2 | regex3 | regex4 | regex5 'ie, startAt = 0 What we need is a new MultiRegex that only includes the remaining possibilities: regex4 | regex5 'ie, startAt = 3 This class wraps all that complexity up in a simple API... `startAt` decides where in the array of expressions to start doing the matching. It auto-increments, so if a match is found at position 2, then startAt will be set to 3. If the end is reached startAt will return to 0. MOST of the time the parser will be setting startAt manually to 0.

```

class ResumableMultiRegex {
  constructor() {
    // @ts-ignore
    this.rules = [];
    // @ts-ignore
    this.multiRegexes = [];
    this.count = 0;
    this.lastIndex = 0;
    this.regexIndex = 0;
  }
  // @ts-ignore
  getMatcher(index) {
    if (this.multiRegexes[index]) return this.multiRegexes[index];
    const matcher = new MultiRegex();
    this.rules.slice(index).forEach((re, opts) => matcher.addRule(re, opts));
    matcher.compile();
    this.multiRegexes[index] = matcher;
    return matcher;
  }
  resumingScanAtSamePosition() {
    return this.regexIndex !== 0;
  }
  considerAll() {
    this.regexIndex = 0;
  }
  // @ts-ignore
  addRule(re, opts) {
    this.rules.push([re, opts]);
    if (opts.type === "begin") this.count++;
  }
  /** @param {string} s */
  exec(s) {
    const m = this.getMatcher(this.regexIndex);
    m.lastIndex = this.lastIndex;
    let result = m.exec(s);
    // The following is because we have no easy way to say "resume scanning at the existing position but also skip the current rule ONLY". What happens is all prior rules are also skipped which can result in matching the wrong thing. Example of matching "booger": our matcher is [string, "booger", number] // our matcher is [string, "booger", number] // if "booger" is ignored then we'd really need a regex to scan from the SAME position for only: [string, number] but ignoring "booger" (if it was the first match), a simple resume would scan ahead who knows how far looking only for "number", ignoring potential string matches (or future "booger" matches that might be valid.) // So what we do: We execute two matchers, one resuming at the same position, but the second full matcher starting at the position after: /--- resume first regex match here (for [number]) // |---- full match here for [string, "booger", number] // vv // ...booger... // Which ever results in a match first is then used. So this 3-4 step process essentially allows us to say "match at this position, excluding a prior rule that was ignored". // 1. Match "booger" first, ignore. Also proves that [string] does non match. // 2. Resume matching for [number] // 3. Match at index + 1 for [string, "booger", number] // 4. If #2 and #3 result in matches, which came first?
    if (this.resumingScanAtSamePosition()) {
      if (result && result.index === this.lastIndex); else { // use the second matcher result
        const m2 = this.getMatcher(0);
        m2.lastIndex = this.lastIndex + 1;
        result = m2.exec(s);
      }
    }
    if (result) {
      this.regexIndex += result.position + 1;
      if (this.regexIndex === this.count) {
        // wrap-around to considering all matches again
        this.considerAll();
      }
    }
    return result;
  }

/** skip vs abort vs ignore
 * @skip - The mode is still entered and exited normally (and contains rules apply), but all content is held and added to the parent

```

buffer rather than being output when the mode ends. Mostly used with `sublanguage` to build up a single large buffer than can be parsed by sublanguage.

- The mode begin ends normally.
- Content matched is added to the parent mode buffer.
- The parser cursor is moved forward normally.

`@abort` - A hack placeholder until we have ignore. Aborts the mode (as if it never matched) but DOES NOT continue to match subsequent `contains` modes. Abort is bad/suboptimal because it can result in modes farther down not getting applied because an earlier rule eats the content but then aborts.

- The mode does not begin.
- Content matched by `begin` is added to the mode buffer.
- The parser cursor is moved forward accordingly.

`@ignore` - Ignores the mode (as if it never matched) and continues to match any subsequent `contains` modes. Ignore isn't technically possible with the current parser implementation.

- The mode does not begin.
- Content matched by `begin` is ignored.
- The parser cursor is not moved forward.

`^/` - Compiles an individual mode. This can raise an error if the mode contains certain detectable known logic issues.

    exports: exports
  }
}

```

Expose 'punycode'

```

define('punycode', function() {
  return punycode;
});

```

Some AMD build optimizers, like r.js, check for specific condition patterns like the following:

```

if (typeof define == 'function' &&
  typeof define.amd == 'object' &&
  define.amd) {
  define('punycode', function() {
    return punycode;
  });
} else if (freeExports && freeModule) {
  if (module.exports == freeExports) {
    // in Node.js or RingoJS v0.8.0+
    freeModule.exports = punycode;
  } else {
    // in Narwhal or RingoJS v0.7.0-
    for (key in punycode) {
      punycode.hasOwnProperty(key) &&
        (freeExports[key] = punycode[key]);
    }
  }
} else {
  // in Rhino or a web browser
  root.punycode = punycode;
}

```

Use strict;

```

module.exports = {
  isString: function(arg) {
    return typeof(arg) === 'string';
  },
  isObject: function(arg) {
    return typeof(arg) === 'object' && arg !== null;
  },
  isNull: function(arg) {
    return arg === null;
  },
  isNullOrUndefined: function(arg) {
    return arg == null;
  }
};

```

use strict;

```

exports.decode = exports.parse = require('./decode');
exports.encode = exports.stringify = require('./encode');

```

Date\n * @returns {number} Returns the timestamp.\n * @example\n *\n * _defer(function(stamp) {\n *
  console.log(_now() - stamp);\n * }, _now());\n * // => Logs the number of milliseconds it took for the deferred
invocation.\n *\nvar now = function() {\n  return root.Date.now();\n};\n/**\n * Creates a debounced function that
delays invoking `func` until after `wait` \n * milliseconds have elapsed since the last time the debounced function
was\n * invoked. The debounced function comes with a `cancel` method to cancel\n * delayed `func` invocations
and a `flush` method to immediately invoke them.\n * Provide `options` to indicate whether `func` should be
invoked on the\n * leading and/or trailing edge of the `wait` timeout. The `func` is invoked\n * with the last
arguments provided to the debounced function. Subsequent\n * calls to the debounced function return the result of
the last `func`\n * invocation.\n *\n * **Note:** If `leading` and `trailing` options are `true`, `func` is\n *
invoked on the trailing edge of the timeout only if the debounced function\n * is invoked more than once during the
`wait` timeout.\n *\n * If `wait` is `0` and `leading` is `false`, `func` invocation is deferred\n * until to the
next tick, similar to `setTimeout` with a timeout of `0`.\n *\n * See [David Corbacho's article](https://css-tricks.com/debouncing-
throttling-explained-examples/) \n * for details over the differences between `_.debounce` and `_.throttle`.\n *\n
 * @static\n * @memberOf _\n * @since 0.1.0\n * @category Function\n * @param {Function} func The function to
debounce.\n * @param {number} [wait=0] The number of milliseconds to delay.\n * @param {Object}
[options={}] The options object.\n * @param {boolean} [options.leading=false] Specify invoking on the
leading edge of the timeout.\n * @param {number} [options.maxWait] The maximum time `func` is allowed to
be delayed before it's invoked.\n * @param {boolean} [options.trailing=true] Specify invoking on the trailing
edge of the timeout.\n * @returns {Function} Returns the new debounced function.\n * @example\n *\n * // Avoid
costly calculations while the window size is in flux.\n * jQuery(window).on('resize', _.debounce(calculateLayout,
150));\n *\n * // Invoke `sendMail` when clicked, debouncing subsequent calls.\n * jQuery(element).on('click',

\"core/utills\"\n\n// This stateful component lets us avoid writing competing values (user\n// modifications vs
example values) into global state, and the mess that comes\n// with that: tracking which of the two values are
currently used for\n// Try-It-Out, which example a modified value came from, etc...\n\n// The solution here is to
retain the last user-modified value in\n// ExamplesSelectValueRetainer's component state, so that our global state
can stay\n// clean, always simply being the source of truth for what value should be both\n// displayed to the user
and used as a value during request execution.\n\n// This approach/tradeoff was chosen in order to encapsulate the
particular\n// logic of Examples within the Examples component tree, and to avoid\n// regressions within our current
implementation elsewhere (non-Examples\n// definitions, OpenAPI 2.0, etc). A future refactor to global state might
make\n// this component unnecessary.\n\n// TL;DR: this is not our usual approach, but the choice was made
consciously.\n\n// Note that `currentNamespace` isn't currently used anywhere!\n\nconst stringifyUnlessList = input

// This component provides an interface that feels like an uncontrolled input\n//
to consumers, while providing a `defaultValue` interface that initializes\n//
the input's value using JavaScript value
property APIs instead of React's\n//
vanilla[0] implementation that uses HTML value attributes.\n\n
// This is
useful in situations where we don't want to surface an input's value\n//
into the HTML/CSS-exposed side of the
DOM, for example to avoid sequential\n//
input chaining attacks[1].\n\n
