value && (value.constructor === Object || value.constructor === undefined);\n }\n\n /**\n * An extension of the
\'same-value\' algorithm as [described for use by ES6 Map\n * and Set](https://developer.mozilla.org/en-
US/docs/Web/JavaScript/Reference/Global_Objects/Map#Key_equality)\n * \n * NaN is considered the same as
NaN, however -0 and 0 are considered the same\n * value, which is different from the algorithm described by\n *
[Object.is](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Object/is).\n * \n
* This is extended further to allow Objects to describe the values they\n * represent, by way of `valueOf` or
`equals` (and `hashCode`).\n * \n * Note: because of this extension, the key equality of Immutable.Map and the\n
* value equality of Immutable.Set will differ from ES6 Map and Set.\n * \n * ### Defining custom values\n * \n
* The easiest way to describe the value an object represents is by implementing\n * `valueOf`. For example, `Date`
represents a value by returning a unix\n * timestamp for `valueOf`:\n * \n * var date1 = new
Date(1234567890000); // Fri Feb 13 2009 ... \n * var date2 = new Date(1234567890000);\n *
date1.valueOf(); // 1234567890000\n * assert( date1 !== date2 );\n * assert( Immutable.is( date1, date2 ) );\n
*\n * Note: overriding `valueOf` may have other implications if you use this object\n * where JavaScript expects
a primitive, such as implicit string coercion.\n * \n * For more complex types, especially collections,
implementing `valueOf` may\n * not be performant. An alternative is to implement `equals` and `hashCode`.\n
*\n * `equals` takes another object, presumably of similar type, and returns true\n * if the it is equal. Equality is
symmetrical, so the same result should be\n * returned if this and the argument are flipped.\n * \n * assert(
a.equals(b) === b.equals(a) );\n * \n * `hashCode` returns a 32bit integer number representing the object which
will\n * be used to determine how to store the value object in a Map or Set. You must\n * provide both or neither
methods, one must not exist without the other.\n * \n * Also, an important relationship between these methods
must be upheld: if two\n * values are equal, they *must* return the same hashCode. If the values are not\n *
equal, they might have the same hashCode; this is called a hash collision,\n * and while undesirable for
performance reasons, it is acceptable.\n * \n * if (a.equals(b)) {\n * assert( a.hashCode() === b.hashCode()
);\n * }\n * \n * All Immutable collections implement `equals` and `hashCode`.\n * \n */\n function

Map from property `"standard name"` to an object with info about how to set the property in the DOM. Each object contains:

- `attributeName`: Used when rendering markup or with `*Attribute()`.
- `attributeNamespace`: property name. Used on DOM node instances. (This includes properties that mutate due to external factors.)
- `mutationMethod`: If non-null, used instead of the property or `*setAttribute()` after initial render.
- `mustUseProperty`: Whether the property must be accessed and mutated as an object property.
- `hasBooleanValue`: Whether the property should be removed when set to a falsey value.
- `hasNumericValue`: Whether the property must be numeric or parse as a numeric and should be removed when set to a falsey value.
- `hasPositiveNumericValue`: Whether the property must be positive numeric or parse as a positive numeric and should be removed when set to a falsey value.
- `hasOverloadedBooleanValue`: Whether the property can be used as a flag as well as with a value. Removed when strictly equal to false; present without a value when strictly equal to true; present with a value otherwise.

`^` properties: `{}`, Mapping from lowercase property names to the properly cased version, used to warn in the case of missing properties. Available only in `__DEV__`.

`autofocus` is predefined, because adding it to the property whitelist causes unintended side effects.

`@type {Object}`

`getPossibleStandardName`: `process.env.NODE_ENV !== 'production' ? { autofocus: 'autoFocus' } : null`

All of the `isCustomAttribute()` functions that have been injected.

`_isCustomAttributeFunctions`: Checks whether a property name is a custom attribute.

`@method`

`isCustomAttribute`: `function (attributeName) { for (var i = 0; i < DOMProperty._isCustomAttributeFunctions.length; i++) { var isCustomAttributeFn = DOMProperty._isCustomAttributeFunctions[i]; if (isCustomAttributeFn(attributeName)) { return true; } } return false; }`

injection: `DOMPropertyInjection`

module.exports = `DOMProperty`;

`ReactRef = require('./ReactRef');`

`ReactInstrumentation = require('./ReactInstrumentation');`

`warning = require('fbjs/lib/warning');`

Helper to call `ReactRef.attachRefs` with this composite component, split out to avoid allocations in the transaction mount-ready queue.

`function attachRefs() { ReactRef.attachRefs(this, this._currentElement); }`

`ReactReconciler = { }`

Initializes the component, renders markup, and registers event listeners.

`@param {ReactComponent} internalInstance`

`@param {ReactReconcileTransaction|ReactServerRenderingTransaction} transaction`

`@param {?object} the containing host component instance`

`@param {?object} info about the host container`

`@return {?string}` Rendered markup to be inserted into the DOM.

`@final`

`@internal`

`mountComponent`: `function (internalInstance, transaction, hostParent, hostContainerInfo, context, parentDebugID) // 0 in production and for roots { if (process.env.NODE_ENV !== 'production') { if (internalInstance._debugID !== 0) { ReactInstrumentation.debugTool.onBeforeMountComponent(internalInstance._debugID, internalInstance._currentElement, parentDebugID); } } var markup = internalInstance.mountComponent(transaction, hostParent, hostContainerInfo, context, parentDebugID); if (internalInstance._currentElement && internalInstance._currentElement.ref !== null) { transaction.getReactMountReady().enqueue(attachRefs, internalInstance); } } if (process.env.NODE_ENV !== 'production') { if (internalInstance._debugID !== 0) { ReactInstrumentation.debugTool.onMountComponent(internalInstance._debugID); } } return markup; }`

Returns a value that can be passed to `ReactComponentEnvironment.replaceNodeWithMarkup`.

`getNode`: `function (internalInstance) { return internalInstance.getHostNode(); }`

Releases any resources allocated by `*mountComponent*`.

`@final`

`@internal`

`unmountComponent`: `function (internalInstance, safely) { if (process.env.NODE_ENV !== 'production') { if (internalInstance._debugID !== 0) { ReactInstrumentation.debugTool.onBeforeUnmountComponent(internalInstance._debugID); } } ReactRef.detachRefs(internalInstance, internalInstance._currentElement); internalInstance.unmountComponent(safely); if (process.env.NODE_ENV !== 'production') { if`

*) Turns an object whose values are different reducer functions, into a single

reducer function. It will call every child reducer, and gather their results

into a single state object, whose keys

correspond to the keys of the passed

reducer functions.

@param {Object} reducers An object whose

values correspond to different

reducer functions that need to be combined into one. One handy way to obtain

it is to use ES6 `import * as reducers` syntax. The reducers may never return

undefined for any action. Instead,

they should return their initial state

if the state passed to them was undefined, and the current state for any

unrecognized action.

@returns {Function} A reducer function that invokes every reducer inside the

passed object, and builds a state object with the same shape.

export default function

```

combineReducers(reducers) {
  var reducerKeys = Object.keys(reducers);
  var finalReducers = {};
  for (var i =
0; i < reducerKeys.length; i++) {

  return function ()
{
    return dispatch(actionCreator.apply(undefined, arguments));
  };
}");
*) Turns an object whose values
are action creators, into an object with the

same keys, but with every function wrapped into a dispatch call so

they

may be invoked directly. This is just a convenience method, as you can call

store.dispatch(MyActionCreators.doSomething()) yourself just fine.

*) For convenience, you can also pass a

single function as the first argument,

and get a function in return.

@param {Function|Object}

actionCreators An object whose values are action

creator functions. One handy way to obtain it is to use ES6

import * as syntax. You may also pass a single function.

@param {Function} dispatch The dispatch

function available on your Redux

store.

@returns {Function|Object} The object mimicking the original

object, but with

every action creator wrapped into the dispatch call. If you passed a

function as

actionCreators, the return value will also be a single

function.

export default function

/**
 * @abstract
 * @class
Autolinker.match.Match
 * Represents a match found in an input string which should be Autolinked. A Match object is what is provided in a { @link Autolinker#replaceFn replaceFn }, and may be used to query for details about the match.
 * For example:
 * var input = "..."; // string with URLs, Email Addresses, and Mentions (Twitter, Instagram, Soundcloud)
 * var linkedText = Autolinker.link( input, {
 *   replaceFn : function( match ) {
 *     console.log( "href = ", match.getAnchorHref() );
 *     console.log( "text = ", match.getAnchorText() );
 *     switch( match.getType() ) {
 *       case 'url':
 *         console.log( "url: ", match.getUrl() );
 *       case 'email':
 *         console.log( "email: ", match.getEmail() );
 *       case 'mention':
 *         console.log( "mention: ", match.getMention() );
 *     }
 *   }
 * });
 * See the { @link Autolinker } class for more details on using the { @link Autolinker#replaceFn replaceFn }.
^/nvar Match = /**
 * @class
 */ (function () {
  /**
   * @member Autolinker.match.Match
   * @method constructor
   * @param {Object} cfg The configuration properties for the Match instance, specified in an Object (map).
   ^/n function Match(cfg) {
   /**
   * @cfg {Autolinker.AnchorTagBuilder} tagBuilder (required)
   ^/n * Reference to the AnchorTagBuilder instance to use to generate an anchor tag for the Match.
   ^/n
   this.__jsduckDummyDocProp = null; // property used just to get the above doc comment into the ES5 output and documentation generator
   /**
   * @cfg {String} matchedText (required)
   ^/n * The original text that was matched by the { @link Autolinker.matcher.Matcher }.
   ^/n this.matchedText = ""; // default value just to get the above doc comment in the ES5 output and documentation generator
   /**
   * @cfg {Number} offset (required)
   ^/n * The offset of where the match was made in the input string.
   ^/n
   this.offset = 0; // default value just to get the above doc comment in the ES5 output and documentation generator
   this.tagBuilder = cfg.tagBuilder;
   this.matchedText = cfg.matchedText;
   this.offset = cfg.offset;
 }
 /**
 * Returns the original text that was matched.
 * @return {String}
 ^/n
 Match.prototype.getMatchedText = function () {
  return this.matchedText;
 };
 /**
 * Sets the { @link #offset } of where the match was made in the input string.
 * @param {Number} offset
 * A { @link Autolinker.matcher.Matcher } will be fed only HTML text nodes, and will therefore set an original offset that is relative to the HTML text node itself. However, we want this offset to be relative to the full HTML input string, and thus if using { @link Autolinker#parse } (rather than calling a { @link Autolinker.matcher.Matcher } directly), then this offset is corrected after the Matcher itself has done its job.
 * @param {Number} offset
 ^/n Match.prototype.setOffset = function (offset) {
  this.offset = offset;
 };
 /**
 * Returns the offset of where the match was made in the input string. This is the 0-based index of the match.
 * @return {Number}
 ^/n Match.prototype.getOffset = function () {
  return this.offset;
 };
 /**
 * Returns the CSS class suffix(es) for this match.
 * A CSS class suffix is appended to the { @link Autolinker#className } in the { @link Autolinker.AnchorTagBuilder } when a match is translated into an anchor tag.
 * For example, if { @link Autolinker#className } was configured as 'myLink', and this method returns `[ 'url' ]`, the final class name of the element will become: 'myLink myLink-url'.
 * The match may provide multiple CSS class suffixes to be appended to the { @link Autolinker#className } in order to facilitate better styling options for different match criteria. See { @link Autolinker.match.Mention } for an example.
 * By default, this method returns a single array with the match's { @link #getType type } name, but may be overridden by subclasses.
 * @return {String[]}
 ^/n Match.prototype.getCssClassSuffixes = function () {
  return [this.getType()];
 };
 /**
 * Builds and returns an { @link Autolinker.HtmlTag } instance based on the Match.
 * This can be used to easily generate anchor tags from matches, and either return their HTML string, or modify them before doing so.
 * Example Usage:
 * var tag =

```

```

match.buildTag();\n * tag.addClass( 'cordova-link ');\n * tag.setAttr( 'target', '_system');\n * \n *
tag.toAnchorString(); // <a href="http://google.com" class="cordova-link" target="_system">Google</a>\n
*\n * Example Usage in { @link Autolinker#replaceFn }:\n * \n * var html = Autolinker.link( \'Test
google.com\'), {\n * replaceFn : function( match ) {\n * var tag = match.buildTag(); // returns an
{ @link Autolinker.HtmlTag } instance\n * tag.setAttr( 'rel', 'nofollow');\n * \n * return tag;\n
* } \n * });\n * \n * // generated html:\n * // Test <a href="http://google.com"
target="_blank" rel="nofollow">google.com</a>\n * \n Match.prototype.buildTag = function () {\n
return this.tagBuilder.build(this);\n }; \n return Match;\n})();\nexport { Match }; \n\n//

.source; // see note in above variable
description\n
*/\n
* The string form of a regular expression that would match all of the\n
* alphabetic ("letter")
chars, emoji, and combining marks in the unicode character set\n
* when placed in a RegExp character class ( []).
This includes all\n
* international alphabetic characters.\n
*/\n
* These would be the characters matched by unicode
regex engines `\\p{L}\\p{M}`\n
* escapes and emoji characters.\n
^\nexport var alphaCharsAndMarksStr =
alphaCharsStr + emojiStr + marksStr;\n
*/\n
* The string form of a regular expression that would match all of the\n
* decimal number chars in the unicode character set when placed in a RegExp\n
* character class ( []).\n
*/\n
* These would be the characters matched by unicode regex engines `\\p{Nd}`\n
* escape ("all decimal numbers")\n
*/\n
* Taken from the XRegExp library: http://xregexp.com/ (thanks @https://github.com/slevithan)\n
* Specifically:
http://xregexp.com/v/3.2.0/xregexp-all.js, the 'Decimal_Number'\n
* regex's bmp\n
*/\n
* VERY IMPORTANT:
This set of characters is defined inside of a Regular\n
* Expression literal rather than a string literal to prevent
UglifyJS from\n
* compressing the unicode escape sequences into their actual unicode\n
* characters. If Uglify
compresses these into the unicode characters\n
* themselves, this results in the error "Range out of order in
character\n
* class" when these characters are used inside of a Regular Expression\n
* character class ( []). See
usages of this const. Alternatively, we can set\n
* the UglifyJS option `ascii_only` to true for the build, but that
doesn't\n
* help others who are pulling in Autolinker into their own build and running\n
* UglifyJS themselves.\n

```

Callback function to call when a close tag is parsed. Called with the tagName as its argument. If a self-closing tag is found, `onCloseTag` is called immediately after `onOpenTag`.

Callbacks.onText Callback function to call when text (i.e. not an HTML tag) is parsed. Called with the text (string) as its first argument, and offset (number) into the string as its second.

```

/**
 * @class Autolinker
 * @extends Object
 * Utility class used to process a given string of text, and wrap the matches in the appropriate anchor (&lt;a&gt;) tags to turn them into links.
 * Any of the configuration options may be provided in an Object provided to the Autolinker constructor, which will configure how the { @link #link link() } method will process the links.
 * For example:
 * var autolinker = new Autolinker( {
 *   newWindow : false,
 *   truncate : 30
 * });
 * var html = autolinker.link("Joe went to www.yahoo.com");
 * // produces: 'Joe went to <a href="http://www.yahoo.com">yahoo.com</a>'
 * The { @link #static-link static link() } method may also be used to inline options into a single call, which may be more convenient for one-off uses.
 * For example:
 * var html = Autolinker.link("Joe went to www.yahoo.com", {
 *   newWindow : false,
 *   truncate : 30
 * });
 * // produces: 'Joe went to <a href="http://www.yahoo.com">yahoo.com</a>'
 * ## Custom Replacements of Links
 * If the configuration options do not provide enough flexibility, a { @link #replaceFn } may be provided to fully customize the output of Autolinker. This function is called once for each URL/Email/Phone#/Hashtag/Mention (Twitter, Instagram, Soundcloud) match that is encountered.
 * For example:
 * var input = "..."; // string with URLs, Email Addresses, Phone #s, Hashtags, and Mentions (Twitter, Instagram, Soundcloud)
 * var linkedText = Autolinker.link( input, {
 *   replaceFn : function( match ) {
 *     console.log("href = ", match.getAnchorHref());
 *     console.log("text = ", match.getAnchorText());
 *     switch( match.getType() ) {
 *       case 'url':
 *         console.log("url: ", match.getUrl());
 *         if( match.getUrl().indexOf('mysite.com') === -1 ) {
 *           var tag = match.buildTag(); // returns an `Autolinker.HtmlTag` instance, which provides mutator methods for easy changes
 *           tag.setAttr( 'rel', 'nofollow' );
 *           tag.addClass( 'external-link' );
 *           return tag;
 *         } else {
 *           return true; // let Autolinker perform its normal anchor tag replacement
 *         }
 *       case 'email':
 *         var email = match.getEmail();
 *         console.log("email: ", email);
 *         if( email === "my@own.address" ) {
 *           return false; // don't auto-link this particular email address; leave as-is
 *         } else {
 *           return; // no return value will have Autolinker perform its normal anchor tag replacement (same as returning `true`)
 *         }
 *       case 'phone':
 *         var phoneNumber = match.getPhoneNumber();
 *         console.log( phoneNumber );
 *         return '<a href="http://newplace.to.link.phone.numbers.to/">' + phoneNumber + '</a>';
 *       case 'hashtag':
 *         var hashtag = match.getHashtag();
 *         console.log( hashtag );
 *         return '<a href="http://newplace.to.link.hashtag.handles.to/">' + hashtag + '</a>';
 *       case 'mention':
 *         var mention = match.getMention();
 *         console.log( mention );
 *         return '<a href="http://newplace.to.link.mention.to/">' + mention + '</a>';
 *     }
 *   }
 * });
 * The function may return the following values:
 * - `true` (Boolean): Allow Autolinker to replace the match as it normally would.
 * - `false` (Boolean): Do not replace the current match at all - leave as-is.
 * - Any String: If a string is returned from the function, the string will be used directly as the replacement HTML for the match.
 * - An { @link Autolinker.HtmlTag } instance, which can be used to build/modify an HTML tag before writing out its HTML text.

/**
 * Automatically links URLs, Email addresses, Phone Numbers, Twitter handles, Hashtags, and
Mentions found in the given chunk of HTML. Does not link URLs found within HTML tags.
* For instance, if given the text: `You should go to http://www.yahoo.com`, then the result will be `You should go
to <a href="http://www.yahoo.com">http://www.yahoo.com</a>`.
* Example:
* var linkedText = Autolinker.link("Go to google.com", { newWindow: false });
* // Produces: "Go to <a href="http://google.com">google.com</a>".
* @static
* @param {String} textOrHtml The HTML or text to find matches within (depending on if the {Autolinker#urls}, {Autolinker#email}, {Autolinker#phone}, {Autolinker#mention}, {Autolinker#hashtag}, and {Autolinker#mention} options are enabled).
* @param {Object} [options] Any of the configuration options for the Autolinker class, specified in an Object (map). See the class description for an example call.
* @return {String} The HTML text, with matches automatically linked.
Autolinker.link = function(textOrHtml, options) {
var autolinker = new
Autolinker(options);
return autolinker.link(textOrHtml);
};
/**
 * Parses the input `textOrHtml` looking for URLs, email addresses, phone numbers, username handles, and hashtags (depending on the configuration of the Autolinker instance), and returns an array of {Autolinker.match.Match} objects describing those matches (without making any replacements).
* Note that if parsing multiple pieces of text, it is slightly more efficient to create an Autolinker instance, and use the instance-level {Autolinker#parse} method.
* Example:
* var matches = Autolinker.parse("Hello google.com, I am asdf@asdf.com", {
urls: true,
email: true
});
console.log(matches.length); // 2
console.log(matches[0].getType()); // 'url'
console.log(matches[0].getUrl()); // 'google.com'
console.log(matches[1].getType()); // 'email'
console.log(matches[1].getEmail()); // 'asdf@asdf.com'
* @static
* @param {String} textOrHtml The HTML or text to find matches within (depending on if the {Autolinker#urls}, {Autolinker#email}, {Autolinker#phone},

```

```

```

handles, and hashtags (depending on the configuration of the Autolinker instance), and returns an array of `@link Autolinker.match.Match` objects describing those matches. This method processes a non-HTML string, and is used to parse and match within the text nodes of an HTML string. This method is used internally by `@link #parse`. `@private @param {String} text` The text to find matches within (depending on if the `@link #urls`, `@link #email`, `@link #phone`, `@link #hashtag`, and `@link #mention` options are enabled). This must be a non-HTML string. `@param {Number} [offset=0]` The offset of the text node within the original string. This is used when parsing with the `@link #parse` method to generate correct offsets within the `@link Autolinker.match.Match` instances, but may be omitted if calling this method publicly. `@return {Autolinker.match.Match[]}` The array of Matches found in the given input `text`.

```
Autolinker.prototype.parseText = function (text, offset) {
  if (offset === void 0) { offset = 0; }
  offset = offset || 0;
  var matchers = this.getMatchers(), matches = [];
  for (var i = 0, numMatchers = matchers.length; i < numMatchers; i++) {
    var textMatches = matchers[i].parseMatches(text);
    // Correct the offset of each of the matches. They are originally
    // the offset of the match within the provided text node, but we
    // need to correct them to be relative to the
    // original HTML input string (i.e. the one provided to #parse).
    for (var j = 0, numTextMatches = textMatches.length; j < numTextMatches; j++) {
      textMatches[j].setOffset(offset + textMatches[j].getOffset());
    }
    matches.push.apply(matches, textMatches);
  }
