value && (value.constructor === Object || value.constructor === undefined);\n }\n\n /**\n * An extension of the
\'same-value\' algorithm as [described for use by ES6 Map\n * and Set](https://developer.mozilla.org/en-
US/docs/Web/JavaScript/Reference/Global_Objects/Map#Key_equality)\n *\n * NaN is considered the same as
NaN, however -0 and 0 are considered the same\n * value, which is different from the algorithm described by\n *
[Object.is](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Object/is).\n *\n
* This is extended further to allow Objects to describe the values they\n * represent, by way of `valueOf` or
`equals` (and `hashCode`).\n *\n * Note: because of this extension, the key equality of Immutable.Map and the\n
* value equality of Immutable.Set will differ from ES6 Map and Set.\n *\n * ### Defining custom values\n *\n
* The easiest way to describe the value an object represents is by implementing\n * `valueOf`. For example, `Date`
represents a value by returning a unix\n * timestamp for `valueOf`:\n *\n *   var date1 = new
Date(1234567890000); // Fri Feb 13 2009 ...
\n *   var date2 = new Date(1234567890000);\n *
date1.valueOf(); // 1234567890000\n *   assert( date1 !== date2 );\n *   assert( Immutable.is( date1, date2 ) );\n
*\n * Note: overriding `valueOf` may have other implications if you use this object\n * where JavaScript expects
a primitive, such as implicit string coercion.\n *\n * For more complex types, especially collections,
implementing `valueOf` may\n * not be performant. An alternative is to implement `equals` and `hashCode`.\n
*\n * `equals` takes another object, presumably of similar type, and returns true\n * if the it is equal. Equality is
symmetrical, so the same result should be\n * returned if this and the argument are flipped.\n *\n *   assert(
a.equals(b) === b.equals(a) );\n *\n * `hashCode` returns a 32bit integer number representing the object which
will\n * be used to determine how to store the value object in a Map or Set. You must\n * provide both or neither
methods, one must not exist without the other.\n *\n * Also, an important relationship between these methods
must be upheld: if two\n * values are equal, they *must* return the same hashCode. If the values are not\n
* equal, they might have the same hashCode; this is called a hash collision,\n * and while undesirable for
performance reasons, it is acceptable.\n *\n *   if (a.equals(b)) {\n *     assert( a.hashCode() === b.hashCode()
);\n *   }\n *\n * All Immutable collections implement `equals` and `hashCode`.\n *\n */\n\n function
