-> [ 'a', 'b', 'c' ]\\n *\\n * This method emulates the functionality of modern browsers for the old IE case.\\n *\\n *
@param {String} str The string to split.\\n * @param {RegExp} splitRegex The regular expression to split the input

```

```

`str` on. The splitting character(s) will be spliced into the array, as in the "modern browsers" example in the
description of this method. Note #1: the supplied regular expression **must** have the 'g' flag specified.
Note #2: for simplicity's sake, the regular expression does not need to contain capturing parenthesis - it will be
assumed that any match has them. @return {String[]} The split array of strings, with the splitting character(s)
included.
export function splitAndCapture(str, splitRegex) {
  if (!splitRegex.global) throw new Error("splitRegex must have the 'g' flag set");
  var result = [], lastIdx = 0, match;
  while (match = splitRegex.exec(str)) {
    result.push(str.substring(lastIdx, match.index));
    result.push(match[0]); // push the splitting char(s)
    lastIdx = match.index + match[0].length;
  }
  result.push(str.substring(lastIdx));
  return result;
}

} from './utils';
class Autolinker.HtmlTag extends Object {
  /**
   * Represents an HTML tag, which can be used to easily build/modify HTML tags programmatically.
   * Autolinker uses this abstraction to create HTML tags, and then write them out as strings. You may also use this class in your code, especially
   * within a { @link Autolinker#replaceFn replaceFn }.
   * ## Examples
   * Example instantiation:
   * var tag = new Autolinker.HtmlTag( {
   *   tagName : 'a',
   *   attrs : { 'href': 'http://google.com', 'class': 'external-link' },
   *   innerHtml : 'Google'
   * });
   * tag.toAnchorString(); // <a href="http://google.com" class="external-link">Google</a>
   * // Individual accessor methods
   * tag.getTagName(); // 'a'
   * tag.getAttr( 'href' ); // 'http://google.com'
   * tag.hasClass( 'external-link' ); // true
   *
   * Using mutator methods (which may be used in combination with instantiation config properties):
   * var tag = new Autolinker.HtmlTag();
   * tag.setTagName( 'a' );
   * tag.setAttr( 'href', 'http://google.com' );
   * tag.addClass( 'external-link' );
   * tag.setInnerHtml( 'Google' );
   *
   * tag.getTagName(); // 'a'
   * tag.getAttr( 'href' ); // 'http://google.com'
   * tag.hasClass( 'external-link' ); // true
   * tag.toAnchorString(); // <a href="http://google.com" class="external-link">Google</a>
   *
   * ## Example use within a { @link Autolinker#replaceFn replaceFn }
   * var html = Autolinker.link( "Test google.com", {
   *   replaceFn : function( match ) {
   *     var tag = match.buildTag(); // returns an { @link Autolinker.HtmlTag } instance, configured with the Match's href and anchor text
   *     tag.setAttr( 'rel', 'nofollow' );
   *     return tag;
   *   }
   * });
   * // generated html:
   * // Test <a href="http://google.com" target="_blank" rel="nofollow">google.com</a>
   *
   * ## Example use with a new tag for the replacement
   * var html = Autolinker.link( "Test google.com", {
   *   replaceFn : function( match ) {
   *     var tag = new Autolinker.HtmlTag( {
   *       tagName : 'button',
   *       attrs : { 'title': 'Load URL: ' + match.getAnchorHref() },
   *       innerHtml : 'Load URL: ' + match.getAnchorText()
   *     });
   *     return tag;
   *   }
   * });
   * // generated html:
   * // Test <button title="Load URL: http://google.com">Load URL: google.com</button>
   */
  nvar HtmlTag = /** @class */ (function () {
    /**
     * @method constructor
     * @param {Object} [cfg]

characters (0-31), and\n * the backspace char (127)\n */\nexport var controlCharsRe = /[\\x00-\\x1F\\x7F]/;\n/**\n *
The string form of a regular expression that would match all of the\n * alphabetic ("letter") chars in the unicode
character set when placed in a\n * RegExp character class ([ ]). This includes all international alphabetic\n *
characters.\n *\n * These would be the characters matched by unicode regex engines \\p{L}\n * escape ("all
letters").\n *\n * Taken from the XRegExp library: http://xregexp.com/ (thanks @https://github.com/slevithan)\n *
Specifically: http://xregexp.com/v/3.2.0/xregexp-all.js, the 'Letter'\n * regex's bmp\n *\n * VERY IMPORTANT:
This set of characters is defined inside of a Regular\n * Expression literal rather than a string literal to prevent
UglifyJS from\n * compressing the unicode escape sequences into their actual unicode\n * characters. If Uglify
compresses these into the unicode characters\n * themselves, this results in the error "Range out of order in
character\n * class" when these characters are used inside of a Regular Expression\n * character class ([ ]). See
usages of this const. Alternatively, we can set\n * the UglifyJS option `ascii_only` to true for the build, but that
doesn't\n * help others who are pulling in Autolinker into their own build and running\n * UglifyJS themselves.\n

Unfortunately, we ran into a bunch of catastrophic backtracking issues\n * with certain input text, causing Autolinker to either hang or just take a\n * really long time to parse the string.\n * The current code is intended to be a O(n) algorithm that walks through\n * the string in one pass, and tries to be as cheap as possible. We don't need\n * to implement the full HTML spec, but rather simply determine where the string\n * looks like an HTML tag, and where it looks like text (so that we can autolink\n * that).\n * This state machine parser is intended just to be a simple but performant\n * parser of HTML for the subset of requirements we have. We simply need to:\n * 1. Determine where HTML tags are\n * 2. Determine the tag name (Autolinker specifically only cares about <a>,\n * <script>, and <style> tags, so as not to link any text within them)\n * We don't need to:\n * 1. Create a parse tree\n * 2. Auto-close tags with invalid markup\n * 3. etc.\n * The other intention behind this is that we didn't want to add external\n * dependencies on the Autolinker utility which would increase its size. For\n * instance, adding htmlparser2 adds 125kb to the minified output file,\n * increasing its final size from 47kb to 172kb (at the time of writing). It\n * also doesn't work exactly correctly, treating the string\n * <3 blah blah blah\n * as an HTML tag.\n * Reference for HTML spec:\n * https://www.w3.org/TR/html51/syntax.html#sec-tokenization\n * @param {String} html The HTML to parse\n * @param {Object} callbacks\n * @param {Function} callbacks.onOpenTag Callback function to call when an open\n * tag is parsed. Called with the tagName as its argument.\n * @param {Function} callbacks.onCloseTag Callback function to call when a close\n * tag is parsed. Called with the tagName as its argument. If a self-closing\n * tag is found, `onCloseTag` is called immediately after `onOpenTag`.\n * @param {Function}

parseHtml } from './htmlParser/parse-html';\n/**\n * @class Autolinker\n * @extends Object\n *\n * Utility class
used to process a given string of text, and wrap the matches in\n * the appropriate anchor (&lt;a&gt;) tags to turn
them into links.\n *\n * Any of the configuration options may be provided in an Object provided\n * to the
Autolinker constructor, which will configure how the { @link #link link() }\n * method will process the links.\n *\n *
For example:\n *\n * var autolinker = new Autolinker( {\n *   newWindow : false,\n *   truncate : 30\n *
} );\n *\n * var html = autolinker.link( "Joe went to www.yahoo.com" );\n * // produces: 'Joe went to <a
href="http://www.yahoo.com">yahoo.com</a>\n *\n * The { @link #static-link static link() } method may also
be used to inline\n * options into a single call, which may be more convenient for one-off uses.\n * For example:\n
*\n * var html = Autolinker.link( "Joe went to www.yahoo.com", {\n *   newWindow : false,\n *
truncate : 30\n * } );\n * // produces: 'Joe went to <a href="http://www.yahoo.com">yahoo.com</a>\n *\n
*\n * ## Custom Replacements of Links\n *\n * If the configuration options do not provide enough flexibility, a
{ @link #replaceFn }\n * may be provided to fully customize the output of Autolinker. This function is\n * called
once for each URL/Email/Phone#/Hashtag/Mention (Twitter, Instagram, Soundcloud)\n * match that is
encountered.\n *\n * For example:\n *\n * var input = "..."; // string with URLs, Email Addresses, Phone #s,
Hashtags, and Mentions (Twitter, Instagram, Soundcloud)\n *\n * var linkedText = Autolinker.link( input, {\n *
  replaceFn : function( match ) {\n *    console.log( "href = ", match.getAnchorHref() );\n *
  console.log( "text = ", match.getAnchorText() );\n *\n *    switch( match.getType() ) {\n *      case 'url'
:\n *        console.log( "url: ", match.getUrl() );\n *\n *        if( match.getUrl().indexOf(
'mysite.com') === -1 ) {\n *          var tag = match.buildTag(); // returns an `Autolinker.HtmlTag`\n
instance, which provides mutator methods for easy changes\n *          tag.setAttr( 'rel', 'nofollow' );\n *
          tag.addClass( 'external-link' );\n *\n *          return tag;\n *\n *        } else {\n *
          return true; // let Autolinker perform its normal anchor tag replacement\n *        }\n *\n *      case
'email' :\n *        var email = match.getEmail();\n *        console.log( "email: ", email );\n *\n *        if( email === "my@own.address" ) {\n *
          return false; // don't auto-link this particular email
address; leave as-is\n *        } else {\n *          return; // no return value will have Autolinker
perform its normal anchor tag replacement (same as returning `true`)\n *        }\n *\n *      case
'phone' :\n *        var phoneNumber = match.getPhoneNumber();\n *        console.log( phoneNumber
);\n *\n *        return '<a href="http://newplace.to.link.phone.numbers.to/">' + phoneNumber + '</a>';\n *\n
*\n *      case 'hashtag' :\n *        var hashtag = match.getHashtag();\n *        console.log( hashtag
);\n *\n *        return '<a href="http://newplace.to.link.hashtag.handles.to/">' + hashtag + '</a>';\n *\n
*\n *      case 'mention' :\n *        var mention = match.getMention();\n *        console.log( mention );\n
*\n *        return '<a href="http://newplace.to.link.mention.to/">' + mention + '</a>';\n *\n *      }\n *
} );\n * } );\n *\n * The function may return the following values:\n *\n * - `true` (Boolean): Allow Autolinker
to replace the match as it normally\n * would.\n * - `false` (Boolean): Do not replace the current match at all -
leave as-is.\n * - Any String: If a string is returned from the function, the string will be\n * used directly as the
replacement HTML for the match.\n * - An { @link Autolinker.HtmlTag } instance, which can be used to
build/modify\n * an HTML tag before writing out its HTML text.\n *\n * ^\n * var Autolinker = /** @class */ (function ()
{\n * /**\n * @method constructor\n * @param {Object} [cfg] The configuration options for the Autolinker
instance,\n * specified in an Object (map).\n * ^\n * function Autolinker(cfg) {\n *   if (cfg === void 0) { cfg

```

```

= { }; } \n      /* \n      * The Autolinker version number exposed on the instance itself. \n      * \n      * Ex:
0.25.1 \n      * \n      this.version = Autolinker.version; \n      /* \n      * @cfg { Boolean/Object } [urls] \n
* \n      * `true` if URLs should be automatically linked, `false` if they should not \n      * be. Defaults to `true`. \n
* \n      * Examples: \n      * \n      * urls: true \n      * \n      * // or \n      * \n      * urls: { \n      *
schemeMatches : true, \n      * \n      * wwwMatches : true, \n      * \n      * tldMatches : true \n      * \n      * } \n
* \n      * As shown above, this option also accepts an Object form with 3 properties \n      * to allow for more
customization of what exactly gets linked. All default \n      * to `true`: \n      * \n      * @cfg { Boolean }
[urls.schemeMatches] `true` to match URLs found prefixed \n      * with a scheme, i.e. `http://google.com`, or
`other+scheme://google.com`, \n      * `false` to prevent these types of matches. \n      * @cfg { Boolean }
[urls.wwwMatches] `true` to match urls found prefixed with \n      * `www.`, i.e. `www.google.com`. `false` to
prevent these types of \n      * matches. Note that if the URL had a prefixed scheme, and \n      *
`schemeMatches` is true, it will still be linked. \n      * @cfg { Boolean } [urls.tldMatches] `true` to match URLs
with known top \n      * level domains (.com, .net, etc.) that are not prefixed with a scheme or \n      *
`www.`. This option attempts to match anything that looks like a URL \n      * in the given text. Ex: `google.com`,
`asdf.org/?page=1`, etc. `false` \n      * to prevent these types of matches. \n      * \n      * \n      * \n
this.urls = { }; // default
value just to get the above doc comment in the ES5 output and documentation generator \n      /* \n      * @cfg
{ Boolean } [email=true] \n      * \n      * `true` if email addresses should be automatically linked, `false` if they
* should not be. \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n

default value just to get the above doc comment in the ES5 output and documentation generator \n      /* \n      *
@cfg { Boolean/Object } [stripPrefix=true] \n      * \n      * `true` if 'http://' (or 'https://') and/or the 'www.' should
be stripped \n      * from the beginning of URL links' text, `false` otherwise. Defaults to \n      * `true`. \n
* \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n
* \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n
Examples: \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n
stripPrefix: true \n      * \n      * // or \n      * \n      * \n      * \n      * \n      * \n      * \n
scheme : true, \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n
www : true \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n
} \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n
As shown above, this option also
accepts an Object form with 2 properties \n      * to allow for more customization of what exactly is prevented from
being \n      * displayed. Both default to `true`: \n      * \n      * \n      * \n      * \n      * \n      * \n
@cfg { Boolean } [stripPrefix.scheme] `true` to
prevent the scheme part of \n      * a URL match from being displayed to the user. Example: \n      *
`http://google.com` will be displayed as `google.com`. `false` to \n      * not strip the scheme. NOTE: Only an
`http://` or `https://` scheme \n      * will be removed, so as not to remove a potentially dangerous scheme \n
* (such as `file://` or `javascript:`) \n      * \n      * \n      * \n      * \n      * \n      * \n
@cfg { Boolean } [stripPrefix.www] www (Boolean): `true` to prevent
the \n      * `www.` part of a URL match from being displayed to the user. Ex: \n      * `www.google.com` will
be displayed as `google.com`. `false` to not \n      * strip the `www.` \n      * \n      * \n      * \n      * \n
this.stripPrefix = { scheme:
true, www: true }; // default value just to get the above doc comment in the ES5 output and documentation
generator \n      /* \n      * @cfg { Boolean } [stripTrailingSlash=true] \n      * \n      * `true` to remove the
trailing slash from URL matches, `false` to keep \n      * the trailing slash. \n      * \n      * \n      * \n
* \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n      * \n
Example when `true`:
`http://google.com/` will be displayed as \n      * `http://google.com`. \n      * \n      * \n      * \n
this.stripTrailingSlash = true;

```

```

// default value just to get the above doc comment in the ES5 output and documentation generator\n      /**\n      *\n      * @cfg {Boolean} [decodePercentEncoding=true]\n      *\n      * `true` to decode percent-encoded characters in\n      * URL matches, `false` to keep\n      * the percent-encoded characters.\n      *\n      * Example when `true`:\n      * `https://en.wikipedia.org/wiki/San_Jos%C3%A9` will\n      * be displayed as\n      * `https://en.wikipedia.org/wiki/San_José`.\n      *\n      * this.decodePercentEncoding = true; // default value just to\n      * get the above doc comment in the ES5 output and documentation generator\n      */\n      *\n      * @cfg\n      * {Number/Object} [truncate=0]\n      *\n      * ## Number Form\n      *\n      * A number for how many\n      * characters matched text should be truncated to\n      * inside the text of a link. If the matched text is over this\n      * number of\n      * characters, it will be truncated to this length by adding a two period\n      * ellipsis (`. .`) to the\n      * end of the string.\n      *\n      * For example: A url like `http://www.yahoo.com/some/long/path/to/a/file`\n      * truncated to 25 characters might look something like this:\n      * `yahoo.com/some/long/pat..`\n      *\n      * Example Usage:\n      *\n      * truncate: 25\n      *\n      * Defaults to `0` for `no truncation.`\n      *\n      * ## Object Form\n      *\n      * An Object may also be provided with two properties:\n      * `length` (Number) and\n      * `location` (String). `location` may be one of the following: `end`\n      * (default),\n      * `middle`, or `smart`.\n      *\n      * Example Usage:\n      *\n      * truncate: { length: 25, location: 'middle'\n      * }\n      *\n      * @cfg {Number} [truncate.length=0] How many characters to allow before\n      * truncation\n      * will occur. Defaults to `0` for `no truncation.`\n      *\n      * @cfg {"end"/"middle"/"smart"}\n      * [truncate.location="end"]\n      *\n      * - `end` (default): will truncate up to the number of characters, and\n      * then\n      * add an ellipsis at the end. Ex: `yahoo.com/some/long/pat..`\n      * - `middle`: will truncate and add\n      * the ellipsis in the middle. Ex:\n      * `yahoo.com/s.th/to/a/file`\n      * - `smart`: for URLs where the algorithm\n      * attempts to strip out unnecessary\n      * parts first (such as the `www.`, then URL scheme, hash, etc.),\n      * attempting to make the URL human-readable before looking for a good\n      * point to insert the ellipsis if it is\n      * still too long. Ex:\n      * `yahoo.com/some..to/a/file`. For more details, see\n      * {@link\n      * Autolinker.truncate.TruncateSmart}.\n      *\n      * this.truncate = { length: 0, location: 'end' }; // default value just\n      * to get the above doc comment in the ES5 output and documentation generator\n      */\n      *\n      * @cfg {String}\n      * className\n      *\n      * A CSS class name to add to the generated links. This class will be added\n      * to all\n      * links, as well as this class plus match suffixes for styling\n      * url/email/phone/hashtag/mention links\n      * differently.\n      *\n      * For example, if this config is provided as `myLink`, then:\n      *\n      * - URL\n      * links will have the CSS classes: `myLink myLink-url`\n      * - Email links will have the CSS classes: `myLink\n      * myLink-email`, and\n      * - Phone links will have the CSS classes: `myLink myLink-phone`\n      * - Hashtag\n      * links will have the CSS classes: `myLink myLink-hashtag`\n      * - Mention links will have the CSS classes:\n      * `myLink myLink-mention myLink-[type]`\n      * where [type] is either `instagram`, `twitter` or\n      * `soundcloud`\n      *\n      * this.className = ` `; // default value just to get the above doc comment in the ES5\n      * output and documentation generator\n      */\n      *\n      * @cfg {Function} replaceFn\n      *\n      * A function to\n      * individually process each match found in the input string.\n      *\n      * See the class's description for usage.\n      *\n      * The `replaceFn` can be called with a different context object (`this`\n      * reference) using the\n      * {@link #context} cfg.\n      *\n      * This function is called with the following parameter:\n      *\n      * @cfg\n      * {Autolinker.match.Match} replaceFn.match The Match instance which\n      * can be used to retrieve information\n      * about the match that the `replaceFn`\n      * is currently processing. See {@link Autolinker.match.Match}\n      * subclasses\n      * for details.\n      *\n      * this.replaceFn = null; // default value just to get the above doc\n      * comment in the ES5 output and documentation generator\n      */\n      *\n      * @cfg {Object} context\n      *\n      * The context object (`this` reference) to call the `replaceFn` with.\n      *\n      * Defaults to this Autolinker\n      * instance.\n      *\n      * this.context = undefined; // default value just to get the above doc comment in the ES5\n      * output and documentation generator\n      */\n      *\n      * @cfg {Boolean} [sanitizeHtml=false]\n      *\n      * `true` to HTML-encode the start and end brackets of existing HTML tags found\n      * in the input string. This\n      * will escape `<` and `>` characters to `&lt;` and\n      * `&gt;`, respectively.\n      *\n      * Setting this to `true`\n      * will prevent XSS (Cross-site Scripting) attacks,\n      * but will remove the significance of existing HTML tags in\n      * the input string. If\n      * you would like to maintain the significance of existing HTML tags while also\n      *

```

making the output HTML string safe, leave this option as `false` and use a tool like <https://github.com/cure53/DOMPurify> (or others) on the input string before running Autolinker.

```

this.sanitizeHtml = false; // default value just to get the above doc comment in the ES5 output and documentation

};
/**
 * Parses the input `textOrHtml` looking for URLs, email addresses, phone numbers, username handles, and hashtags (depending on the configuration of the Autolinker instance), and returns an array of {Autolinker.match.Match} objects describing those matches (without making any replacements).
 * Note that if parsing multiple pieces of text, it is slightly more efficient to create an Autolinker instance, and use the instance-level {Autolinker#parse} method.
 * Example:
 * var matches = Autolinker.parse("Hello google.com, I am asdf@asdf.com", {
  urls: true,
  email: true
 });
 * console.log(matches.length); // 2
 * console.log(matches[0].getType()); // 'url'
 * console.log(matches[0].getUrl()); // 'google.com'
 * console.log(matches[1].getType()); // 'email'
 * console.log(matches[1].getEmail()); // 'asdf@asdf.com'
 * @static
 * @param {String} textOrHtml The HTML or text to find matches within (depending on if the {Autolinker#urls}, {Autolinker#email}, {Autolinker#phone}, {Autolinker#hashtag}, and {Autolinker#mention} options are enabled).
 * @param {Object} [options] Any of the configuration options for the Autolinker class, specified in an Object (map). See the class description for

_asyncToGenerator from "@babel/runtime-corejs3/helpers/asyncToGenerator";\nimport _regeneratorRuntime
from "@babel/runtime-corejs3/regenerator";\n// The subtree resolver is a higher-level interface that allows you
to\n// get the same result that you would from `Swagger.resolve`, but focuses on\n// a subtree of your object.\n\n// It makes several assumptions that allow you to think less about what resolve,\n// specmap, and normalizeSwagger
are doing: if this is not suitable for you,\n// you can emulate `resolveSubtree`'s behavior by talking to the
traditional\n// resolver directly.\n\n// By providing a top-level `obj` and a `path` to resolve within, the subtree\n// at
`path` will be resolved and normalized in the context of your top-level\n// `obj`. You'll get the resolved subtree
you're interest in as a return value\n// (or, you can use `returnEntireTree` to get everything back).\n\n// This is
useful for cases where resolving your entire object is unnecessary\n// and/or non-performant; we use this interface

```

for lazily resolving operations and models in Swagger-UI, which allows us to handle larger definitions. It's likely that Swagger-Client will rely entirely on lazy resolving in future versions. TODO: move the remarks above into project documentation

a transform stream is a readable/writable stream where you do something with the data.
Sometimes it's called a "filter", but that's not a great name for it, since that implies a thing where some bits pass through, and others are simply ignored. (That would be a valid example of a transform, of course.)
While the output is causally related to the input, it's not necessarily symmetric or synchronous transformation.
For example, a zlib stream might take multiple plain-text writes(), and then emit a single compressed chunk some time in the future.
Here's how this works:
The Transform stream has all the aspects of the readable and writable stream classes. When you write(chunk), that calls _write(chunk,cb) internally, and returns false if there's a lot of pending writes buffered up. When you call read(), that calls _read(n) until there's enough pending readable data buffered up.
In a transform stream, the written data is placed in a buffer. When _read(n) is called, it transforms the queued up data, calling the buffered _write cb's as it consumes chunks. If consuming a single written chunk would result in multiple output chunks, then the first outputted bit calls the readcb, and subsequent chunks just go into the read buffer, and will cause it to emit 'readable' if necessary.
This way, back-pressure is actually determined by the reading side, since _read has to be called to start processing a new chunk. However, a pathological inflate type of transform can cause excessive buffering here. For example, imagine a stream where every byte of input is interpreted as an integer from 0-255, and then results in that many bytes of output. Writing the 4 bytes {ff,ff,ff,ff} would result in 1kb of data being output. In this case, you could write a very small amount of input, and end up with a very large amount of output. In such a pathological inflating mechanism, there'd be no way to tell the system to stop doing the transform. A single 4MB write could cause the system to run out of memory.
However, even in such a pathological case, only a single written chunk would be consumed, and then the rest would wait (un-transformed) until the results of the previous transformed chunk were consumed.

Opera, and IE. This event fires after\n * `onKeyPress` and `onCompositionEnd`, but before `onInput`. \n * \n *
`beforeInput` is spec'd but not implemented in any browsers, and\n * the `input` event does not provide any useful
information about what has\n * actually been added, contrary to the spec. Thus, `textInput` is the best\n * available
event to identify the characters that have actually been inserted\n * into the target node.\n * \n * This plugin is also
responsible for emitting `composition` events, thus\n * allowing us to share composition fallback code for both
`beforeInput` and\n * `composition` event types.\n * \nvar BeforeInputEventPlugin = {\n  eventTypes:

var ReactBrowserEventEmitter = require('./ReactBrowserEventEmitter');
var ReactInputSelection = require('./ReactInputSelection');
var ReactInstrumentation = require('./ReactInstrumentation');
var Transaction = require('./Transaction');
var ReactUpdateQueue = require('./ReactUpdateQueue');

```

Ensures that, when possible, the selection range (currently selected text input) is not disturbed by performing the transaction.

```

SELECTION_RESTORATION = {
  /**
   * @return {Selection} Selection information.
   */
  initialize:
    ReactInputSelection.getSelectionInformation,
  /**
   * @param {Selection} sel Selection information returned
   * from `initialize`.
   */
  close: ReactInputSelection.restoreSelection
};

```

Suppresses events (blur/focus) that could be inadvertently dispatched due to high level DOM manipulations (like temporarily removing a text input from the DOM).

```

EVENT_SUPPRESSION = {
  /**
   * @return {boolean} The enabled status
   * of `ReactBrowserEventEmitter` before
   * the reconciliation.
   */
  initialize: function () {
    var
      currentlyEnabled = ReactBrowserEventEmitter.isEnabled();
    ReactBrowserEventEmitter.setEnabled(false);
    return currentlyEnabled;
  },
  /**
   * @param {boolean} previouslyEnabled Enabled status of
   * `ReactBrowserEventEmitter` before the reconciliation occurred.
   */
  close: function (previouslyEnabled) {
    ReactBrowserEventEmitter.setEnabled(previouslyEnabled);
  }
};

```

Provides a queue for collecting `componentDidMount` and `componentDidUpdate` callbacks during the transaction.

```

ON_DOM_READY_QUEUEING = {
  /**
   * Initializes the internal
   * `onDOMReady` queue.
   */
  initialize: function () {
    this.reactMountReady.reset();
  },
  /**
   * After
   * DOM is flushed, invoke all registered `onDOMReady`
   * callbacks.
   */
  close: function () {
    this.reactMountReady.notifyAll();
  }
};

```

Executed within the scope of the `Transaction` instance. Consider these as being member methods, but with an implied ordering while being isolated from each other.

```

TRANSACTION_WRAPPERS = [SELECTION_RESTORATION, EVENT_SUPPRESSION,
  ON_DOM_READY_QUEUEING];

```

if (process.env.NODE_ENV !== 'production') {

```

TRANSACTION_WRAPPERS.push({
  initialize: ReactInstrumentation.debugTool.onBeginFlush,
  close:
    ReactInstrumentation.debugTool.onEndFlush
});

```

Currently:

- The order that these are listed in the transaction is critical.
- Suppresses events.
- Restores selection range.
- Future:
- Restore document/overflow scroll positions that were unintentionally modified via DOM insertions above the top viewport boundary.
- Implement/integrate with customized constraint based layout system and keep track

```
