to\n// get the same result that you would from `Swagger.resolve`, but focuses on\n// a subtree of your object.\n\n// It
makes several assumptions that allow you to think less about what resolve,\n// specmap, and normalizeSwagger
are doing: if this is not suitable for you,\n// you can emulate `resolveSubtree`'s behavior by talking to the
traditional\n\n// resolver directly.\n\n// By providing a top-level `obj` and a `path` to resolve within, the subtree\n// at `path` will be
resolved and normalized in the context of your top-level\n// `obj`. You'll get the resolved subtree you're interest in
as a return value\n// (or, you can use `returnEntireTree` to get everything back).\n\n// This is useful for cases where
resolving your entire object is unnecessary\n// and/or non-performant; we use this interface for lazily resolving
operations\n// and models in Swagger-UI, which allows us to handle larger definitions.\n\n// It's likely that
Swagger-Client will rely entirely on lazy resolving in\n// future versions.\n\n// TODO: move the remarks above

The debounced function comes with a `cancel` method\n      to cancel\n      `func`

```

invocations and a `flush` method to immediately invoke them.
 * Provide `options` to indicate whether `func` should be invoked on the leading and/or trailing edge of the `wait` timeout. The `func` is invoked with the last arguments provided to the debounced function. Subsequent calls to the debounced function return the result of the last `func` invocation.
 * **Note:** If `leading` and `trailing` options are `true`, `func` is invoked on the trailing edge of the timeout only if the debounced function is invoked more than once during the `wait` timeout.
 * If `wait` is `0` and `leading` is `false`, `func` invocation is deferred until to the next tick, similar to `setTimeout` with a timeout of `0`.
 * See [David Corbacho's article](https://css-tricks.com/debouncing-throttling-explained-examples/)

```

* for details over the differences between `_.debounce` and `_.throttle`
@static
@memberOf _
@since 0.1.0
@category Function
@param {Function} func The function to debounce.
@param {number} [wait=0] The number of milliseconds to delay.
@param {Object} [options={}] The options object.
  @param {boolean} [options.leading=false] Specify invoking on the leading edge of the timeout.
  @param {number} [options.maxWait] The maximum time `func` is allowed to be delayed before it's invoked.
  @param {boolean} [options.trailing=true] Specify invoking on the trailing edge of the timeout.
@returns {Function} Returns the new debounced function.
@example
// Avoid costly calculations while the window size is in flux.
jQuery(window).on('resize', _.debounce(calculateLayout, 150));
// Invoke `sendMail` when clicked, debouncing subsequent calls.
jQuery(element).on('click', _.debounce(sendMail, 300, {
  leading: true,
  trailing: false
}));
// Ensure `batchLog` is invoked once after 1 second of debounced calls.
var debounced = _.debounce(batchLog, 250, { 'maxWait': 1000 });

`core/utls`\n\n// This stateful component lets us avoid writing competing values (user\n// modifications vs
example values) into global state, and the mess that comes\n// with that: tracking which of the two values are
currently used for\n// Try-It-Out, which example a modified value came from, etc...\n\n// The solution here is to
retain the last user-modified value in\n// ExamplesSelectValueRetainer's component state, so that our global state
can stay\n// clean, always simply being the source of truth for what value should
be both\n// displayed to the user and used as a value during request execution.\n\n// This approach/tradeoff was
chosen in order to encapsulate the particular\n// logic of Examples within the Examples component tree, and to
avoid\n// regressions within our current implementation elsewhere (non-Examples\n// definitions, OpenAPI 2.0, etc).
A future refactor to global state might make\n// this component unnecessary.\n\n// TL;DR: this is not our usual
approach, but the choice was made consciously.\n\n// Note that `currentNamespace` isn't currently used
anywhere!\n\nconst stringifyUnlessList = input =>\n  List.isList(input) ? input : stringify(input)\n\nexport default
