 * Dispatches an action. It is the only way to trigger a state
 change.
 * The `reducer` function, used to create the store, will be called with the
 current state tree and
 the given `action`. Its return value will be considered the `next`
 state of the tree, and the change listeners will be notified.
 * The base implementation only supports
 plain object actions. If you want to dispatch a Promise, an Observable, a thunk, or something else, you need
 to wrap your store creating function into the corresponding middleware. For
 example, see the
 documentation for the `redux-thunk` package. Even the middleware will eventually dispatch plain object
 actions using this method.
 * @param {Object} action A plain object representing "what changed". It is
 a good idea to keep actions serializable so you can record and replay user
 sessions, or use the time travelling
 `redux-devtools`. An action must have a `type` property which may not be `undefined`. It is a good idea to
 use string constants for action types.
 * @returns {Object} For convenience, the same action object you
 dispatched.
 * Note that, if you use a custom middleware, it may wrap `dispatch()`
 to return something else (for example, a Promise you can await).

documentation generator\n    /**\n     * @protected\n     * @property {RegExp} matcherRegex\n     */\n    * The regular expression to match URLs with an optional scheme, port\n     * number, path, query string, and
hash anchor.\n     *\n     * Example matches:\n     *\n     * http://google.com\n     *
www.google.com\n     * google.com/path/to/file?q1=1&q2=2#myAnchor\n     *\n     * This
regular expression will have the following capturing groups:\n     *\n     * 1. Group that matches a scheme-
prefixed URL (i.e. 'http://google.com').\n     * This is used to match scheme URLs with just a single word, such
as\n     * 'http://localhost', where we won't double
check that the domain name\n     * has at least one dot ('.') in it.\n     * 2. Group that matches a 'www.'
prefixed URL. This is only matched if the\n     * 'www.' text was not prefixed by a scheme (i.e.: not prefixed
by\n     * 'http://', 'ftp:', etc.)\n     * 3. A protocol-relative ('//') match for the case of a 'www.' prefixed\n
* URL. Will be an empty string if it is not a protocol-relative match.\n     * We need to know the character
before the '/' in order to determine\n     * if it is a valid match or the // was in a string we don't want to\n
* auto-link.\n     * 4. Group that matches a known TLD (top level domain), when a scheme\n     * or 'www.'-
prefixed domain is not matched.\n     * 5. A protocol-relative ('//') match for the case of a known TLD prefixed\n
* URL. Will be an empty string if it is not a protocol-relative match.\n     * See #3 for more info.\n
*/\n    _this.matcherRegex = matcherRegex;\n    /**\n     * A regular expression to use to check the
character before a protocol-relative\n     * URL match. We don't want to match a protocol-relative URL if it is

```

intended just to be a simple but performant parser of HTML for the subset of requirements we have. We simply need to:

1. Determine where HTML tags are
2. Determine the tag name (Autolinker specifically only cares about `<a>`, `<script>`, and `<style>` tags, so as not to link any text within them)
3. We don't need to:
 1. Create a parse tree
 2. Auto-close tags with invalid markup
 3. etc.

The other intention behind this is that we didn't want to add external dependencies on the Autolinker utility which would increase its size. For instance, adding `htmlparser2` adds 125kb to the minified output file, increasing its final size from 47kb to 172kb (at the time of writing). It also doesn't work exactly correctly, treating the string `<3 blah blah blah` as an HTML tag.

Reference for HTML spec: <https://www.w3.org/TR/html51/syntax.html#sec-tokenization>

```

@param {String} html The HTML to parse
@param {Object} callbacks
@param {Function} callbacks.onOpenTag Callback function to call when an
open tag is parsed. Called with the tagName as its argument.
@param {Function}
callbacks.onCloseTag Callback function to call when a close tag is parsed. Called with the tagName as its
argument. If a self-closing tag is found, `onCloseTag` is called immediately after `onOpenTag`.
@param {Function} callbacks.onText Callback function to call when text (i.e. not an HTML tag) is parsed. Called with
the text (string) as its first argument, and offset (number) into the string as its second.

appropriate anchor (<a>) tags to turn them into links.\n * Any of the configuration options may be
provided in an Object provided\n * to the Autolinker constructor, which will configure how the { @link #link
link() }\n * method will process the links.\n * For example:\n * \n * var autolinker = new Autolinker( {\n *
newWindow : false,\n * truncate : 30\n * } );\n * \n * var html = autolinker.link( \"Joe went to
www.yahoo.com\" );\n * // produces: 'Joe went to <a href='\"http://www.yahoo.com\">yahoo.com</a>\n *
\n * The { @link #static-link static link() } method may also be used to inline\n * options into a single call,
which may be more convenient for one-off uses.\n * For example:\n * \n * var html = Autolinker.link( \"Joe went
to www.yahoo.com\", {\n * newWindow : false,\n * truncate : 30\n * } );\n * // produces: 'Joe went
to <a href='\"http://www.yahoo.com\">yahoo.com</a>\n * \n * ## Custom Replacements of Links\n * If the
configuration options do not provide enough flexibility, a { @link #replaceFn }\n * may be provided to fully
customize the output of Autolinker. This function is\n * called once for each URL/Email/Phone#/Hashtag/Mention
(Twitter, Instagram, Soundcloud)\n * match that is encountered.\n * For example:\n * \n * var input = \"...\"; //
string with URLs, Email Addresses, Phone #s, Hashtags, and Mentions (Twitter, Instagram, Soundcloud)\n * \n *
var linkedText = Autolinker.link( input, {\n * replaceFn

```

```

\`#\`myHashtag\`")\n      * auto-linked to. The currently-supported values are:\n      *\n      * - 'twitter'\n      * - 'facebook'\n      * - 'instagram'\n      *\n      * Pass `false` to skip auto-linking of hashtags.\n      */\n
this.hashtag
= false; // default value just to get the above doc comment in the ES5 output and documentation generator\n
/**\n      * @cfg {String/Boolean} [mention=false]\n      *\n      * A string for the service name to have mentions (ex: `@myuser`)\n      * auto-linked to. The currently supported values are:\n      *\n      * - 'twitter'\n      * - 'instagram'\n      * - 'soundcloud'\n      *\n      * Defaults to `false` to skip auto-linking of mentions.\n      */\n      this.mention = false; // default value just to get the above doc comment in the ES5 output and documentation generator\n      /**\n      * @cfg {Boolean} [newWindow=true]\n      *\n      * `true` if the links should open in a new window, `false` otherwise.\n      */\n      this.newWindow = true; // default value just to get the above doc comment in the ES5 output and documentation generator\n      /**\n      * @cfg {Boolean/Object} [stripPrefix=true]\n      *\n      * `true` if 'http://' (or 'https://') and/or the 'www.' should be stripped\n      * from the beginning of URL links' text, `false` otherwise. Defaults to\n      * `true`.\n      *\n      * Examples:\n      *\n      * stripPrefix: true\n      * // or\n      * stripPrefix: {\n      *   scheme : true,\n      *   www : true\n      * }\n      *\n      * As shown above, this option also accepts an Object form with 2 properties\n      * to allow for more customization of what exactly is prevented from being\n      * displayed. Both default to `true`:\n      *\n      * @cfg {Boolean} [stripPrefix.scheme] `true` to prevent the scheme part of\n      * a URL match from being displayed to the user. Example:\n      * `http://google.com` will be displayed as `google.com`. `false` to\n      * not strip the scheme. NOTE: Only an `http://` or `https://` scheme\n      * will be removed, so as not to remove a potentially dangerous scheme\n      * (such as `file://` or `javascript:`)\n      *\n      * @cfg {Boolean} [stripPrefix.www] www (Boolean): `true` to prevent the\n      * `www.` part of a URL match from being displayed to the user. Ex:\n      * `www.google.com` will be displayed as `google.com`. `false` to not\n      * strip the `www`.\n      */\n      this.stripPrefix = { scheme: true, www: true\n      }; // default value just to get the above doc comment in the ES5 output and documentation generator\n      /**\n      * @cfg {Boolean} [stripTrailingSlash=true]\n      *\n      * `true` to remove the trailing slash from URL matches, `false` to keep\n      * the trailing slash.\n      *\n      * Example when `true`: `http://google.com/` will be displayed as\n      * `http://google.com`.\n      */\n      this.stripTrailingSlash = true; // default value just to get the above doc comment in the ES5 output and documentation generator\n      /**\n      * @cfg {Boolean} [decodePercentEncoding=true]\n      *\n      * `true` to decode percent-encoded characters in URL matches, `false` to keep\n      * the percent-encoded characters.\n      *\n      * Example when `true`:\n      * `https://en.wikipedia.org/wiki/San_Jos%C3%A9` will\n      * be displayed as\n      * `https://en.wikipedia.org/wiki/San_José`.\n      */\n      this.decodePercentEncoding = true; // default value just to get the above doc comment in the ES5 output and documentation generator\n      /**\n      * @cfg {Number/Object} [truncate=0]\n      *\n      * ## Number Form\n      *\n      * A number for how many characters matched text should be truncated to\n      * inside the text of a link. If the matched text is over this number of\n      * characters, it will be truncated to this length by adding a two period\n      * ellipsis (..) to the end of the string.\n      *\n      * For example: A url like 'http://www.yahoo.com/some/long/path/to/a/file'\n      * truncated to 25 characters might look something like this:\n      * 'yahoo.com/some/long/pat..'\n      *\n      * Example Usage:\n      *\n      * truncate: 25\n      *\n      * Defaults to `0` for "no truncation."\n      *\n      * ## Object Form\n      *\n      * An Object may also be provided with two properties: `length` (Number) and\n      * `location` (String). `location` may be one of the following: 'end'\n      * (default), 'middle', or 'smart'.  

      * Example Usage:\n      * truncate: { length: 25, location: 'middle' }\n      *\n      * @cfg {Number} [truncate.length=0] How many characters to allow before\n      * truncation will occur. Defaults to `0` for "no truncation."  

      * @cfg {"end"|"middle"|"smart"} [truncate.location="end"]\n

```

```

    * - 'smart': for URLs where the algorithm attempts to strip out unnecessary
    * parts first (such as the 'www.', then URL scheme, hash, etc.),
    * attempting to make the URL human-readable before looking for a good
    * point to insert the ellipsis if it is still too long. Ex:
    * 'yahoo.com/some..to/a/file'. For more details, see
    * {@link Autolinker.truncate.TruncateSmart}.
    *
    * this.truncate = { length: 0, location: 'end' }; // default value just to get the above doc comment in the ES5 output
    and documentation generator
    /**
    * @cfg {String} className
    *
    * A CSS class name to
    add to the generated
    links. This class will be added
    * to all links, as well as this class plus match suffixes for styling
    *
    * url/email/phone/hashtag/mention links differently.
    *
    * For example, if this config is provided as
    \"myLink\", then:
    *
    * - URL links will have the CSS classes: \"myLink myLink-url\"
    * - Email
    links will have the CSS classes: \"myLink myLink-email\", and
    * - Phone links will have the CSS classes:
    \"myLink myLink-phone\"
    * - Hashtag links will have the CSS classes: \"myLink myLink-hashtag\"
    *
    * - Mention links will have the CSS classes: \"myLink myLink-mention myLink-[type]\"
    * where [type] is
    either \"instagram\", \"twitter\" or \"soundcloud\"
    *
    *
    * this.className = \"\"; // default value just to get the
    above doc comment in the ES5 output and documentation generator
    /**
    * @cfg {Function}
    replaceFn
    *
    * A function to individually
    process each match found in the input string.
    *
    * See the class's description for usage.
    *
    *
    * The `replaceFn` can be called with a different context object (`this`
    * reference) using the {@link #context}
    cfg.
    *
    * This function is called with the following parameter:
    *
    * @cfg
    {Autolinker.match.Match} replaceFn.match The Match instance which
    * can be used to retrieve information
    about the match that the `replaceFn`
    * is currently processing. See {@link Autolinker.match.Match}
    subclasses
    * for details.
    *
    *
    * this.replaceFn = null; // default value just to get the above doc
    comment in the ES5 output and documentation generator
    /**
    * @cfg {Object} context
    *
    * The context object (`this`
    * reference) to call the `replaceFn` with.
    *
    * Defaults to this Autolinker
    instance.
    *
    *
    *
    * this.context = undefined; // default value just to get the above doc comment in the ES5 output and
    documentation generator
    /**
    * @cfg {Boolean} [sanitizeHtml=false]
    *
    * `true` to
    HTML-encode the start and end brackets of existing HTML tags found
    * in the input string. This will escape
    `<` and `>` characters to `&lt;` and
    * `&gt;`, respectively.
    *
    * Setting this to `true` will prevent
    XSS (Cross-site Scripting) attacks,
    * but will remove the significance of existing HTML tags in the input
    string. If
    * you would like to maintain the significance of existing HTML tags while also
    * making the
    output HTML string safe, leave this option as `false` and use a
    * tool like
    https://github.com/cure53/DOMPurify (or others) on the input string
    * before running Autolinker.
    *
    *
    *
    * this.sanitizeHtml = false; // default value just to get the above doc comment
    in the ES5 output and documentation generator
    /**

=====
\n\n**\n * This plugin resolves the JSON pointers.\n * A major part of this
plugin deals with cyclic references via 2 mechanisms.\n * 1. If a pointer was already resolved before in this path,
halt.\n * 2. If the patch value points to one of the ancestors in this path, halt.\n * \n * Note that either one of these
mechanism is sufficient, both must be in place.\n * For examples:\n * \n * Given the following spec, #1 alone is
insufficient because after the 2nd\n * application, there will be a cyclic object reference.\n * a.b.c: $ref-d\n * d.e.f:
$ref-a (per #1, safe to return patch as no immediate cycle)\n * \n * Given the following spec, #2 alone is insufficient
because although there will\n * never be any cyclic object reference, the plugin will keep producing patches.\n
* a: $ref-b\n * b: $ref-a\n * \n\nvar plugin = {\n key: '$ref',\n plugin: function plugin(ref, key, fullPath,

Sometimes it's called a "filter",\n  // but that's not a great name for\n  it, since that implies a thing where\n  //\n  // some bits pass through, and others are simply ignored. (That would\n  // be a valid example of a transform, of\n  course.)\n  // While the output is causally related to the input, it's not a\n  // necessarily symmetric or synchronous\n  transformation. For example,\n  // a zlib stream might take multiple plain-text writes(), and then\n  // emit a single\n  compressed chunk some time in the future.\n  // Here's how this works:\n  // The Transform stream has all the\n  aspects of the readable and writable\n  // stream classes. When you write(chunk), that calls _write(chunk,cb)\n  // internally, and returns false if there's a lot of pending writes\n  // buffered up. When you call read(), that calls\n  // _read(n) until\n  // there's enough pending readable data buffered up.\n  // In a transform stream, the written data is\n  placed in a buffer. When\n  // _read(n) is called, it transforms the queued up data, calling the\n  // buffered _write cb's\n  as it consumes chunks. If consuming a single\n  // written chunk\n  // would result in multiple output chunks, then the first\n  // outputted bit calls the readcb, and subsequent chunks just\n  go into\n  // the read buffer, and will cause it to emit 'readable' if necessary.\n  // This way, back-pressure is actually\n  determined by the reading side,\n  // since _read has to be called to start processing a new chunk. However,\n  // a\n  pathological inflate type of transform can cause excessive buffering\n  // here. For example, imagine a stream where\n  every byte of input is\n  // interpreted as an integer from 0-255, and then results in that many\n  // bytes of output.\n  Writing the 4 bytes {ff,ff,ff,ff} would result in\n  // 1kb of data being output. In this case, you could write a very\n  small\n  // amount of input, and end up with a very large amount of output. In\n  // such a pathological inflating\n  mechanism, there'd be no way to tell\n  // the system to stop doing the transform. A single 4MB write could\n  // cause\n  the system to run out of memory.\n  // However, even in such\n  // a pathological case, only a single written chunk\n  // would be consumed, and then the rest would wait (un-\n  transformed) until\n  // the results of the previous transformed chunk were consumed.\n  \n  use\n  strict';\n  module.exports = Transform;\n  var Duplex = require('./_stream_duplex');\n  /*<replacement>*\n  var util\n  = require('core-util-is');\n  util.inherits = require('inherits');\n  /*</replacement>*\n  util.inherits(Transform,\n  Duplex);\n  \n  function afterTransform(er, data) {\n    var ts = this._transformState;\n    ts.transforming = false;\n    \n    var\n      cb = ts.writecb;\n    \n    if (!cb) {\n      return this.emit('error', new Error('write callback called multiple\n        times'));\n    }\n  }

```

If ``leading`` and ``trailing`` options are ``true``, ``func`` is invoked on the trailing edge of the timeout only if the debounced function is invoked more than once during the ``wait`` timeout. If ``wait`` is ``0`` and ``leading`` is ``false``, ``func`` invocation is deferred until to the next tick, similar to ``setTimeout`` with a timeout of ``0``. See [David Corbacho's article](https://css-tricks.com/debouncing-throttling-explained-examples/) for details over the differences between ``_.debounce`` and ``_.throttle``.

```

@static
@memberOf _
@since 0.1.0
@category Function
@param {Function} func The function to debounce.
@param {number} [wait=0] The number of milliseconds to delay.
@param {Object} [options={}] The options object.
@param {boolean} [options.leading=false] Specify invoking on the leading edge of the timeout.
@param {number} [options.maxWait] The maximum time `func` is allowed to be delayed before it's invoked.
@param {boolean} [options.trailing=true] Specify invoking on the trailing edge of the timeout.
@returns {Function} Returns the new debounced function.
@example
// Avoid costly calculations while the window size is in flux.
jQuery(window).on('resize', _.debounce(calculateLayout, 150));
// Invoke `sendMail` when clicked, debouncing subsequent calls.
jQuery(element).on('click', _.debounce(sendMail, 300, {
  'leading': true,
  'trailing': false
}));
// Ensure `batchLog` is invoked once after 1 second of debounced calls.

root directory of this source tree.
 * Module that is injectable into `EventPluginHub`, that specifies a deterministic ordering of `EventPlugin`s. A convenient way to reason about plugins, without having to package every one of them. This is better than having plugins be ordered in the same order that they are injected because that ordering would be influenced by the packaging order.
 * `ResponderEventPlugin` must occur before `SimpleEventPlugin` so that preventing default on events is convenient in `SimpleEventPlugin` handlers.
 * `DefaultEventPluginOrder` = ['ResponderEventPlugin', 'SimpleEventPlugin', 'TapEventPlugin', 'EnterLeaveEventPlugin', 'ChangeEventPlugin', 'SelectEventPlugin', 'BeforeInputEventPlugin'];
 * module.exports = DefaultEventPluginOrder;

```

matchData);
} }
/* Created to solve the key deficiency with MultiRegex - there is no way to test for multiple matches at a single location. Why would we need to do that? In the future a more dynamic engine will allow certain matches to be ignored. An

example: if we matched say the 3rd regex in a large group but decided to ignore it - we'd need to start testing again at the 4th regex... but MultiRegex itself gives us no real way to do that. So what this class creates MultiRegexes on the fly for whatever search position they are needed. NOTE: These additional MultiRegex objects are created dynamically. For most grammars most of the time we will never actually need anything more than the first MultiRegex - so this shouldn't have too much overhead. Say this is our search group, and we match regex3, but wish to ignore it. regex1 | regex2 | regex3 | regex4 | regex5 'ie, startAt = 0 What we need is a new MultiRegex that only includes the remaining possibilities: regex4 | regex5

'ie, startAt = 3 This class wraps all that complexity up in a simple API... `startAt` decides where in the array of expressions to start doing

the matching. It auto-increments, so if a match is found at position 2, then startAt will be set to 3. If the end is reached startAt will return to 0. MOST of the time the parser will be setting startAt manually to 0.

  {string} s
  */
  exec(s) {
    const m = this.getMatcher(this.regexIndex);
    m.lastIndex = this.lastIndex;
    let result = m.exec(s);
    // The following is because we have no easy way to say "resume scanning at the
    // existing position but also skip the current rule ONLY". What happens is
    // all prior rules are also skipped which can result in matching the wrong
    // thing. Example of matching "booger":
    // our matcher is [string, "booger", number]
    // ...booger...
    // if "booger" is ignored then we'd really need a regex to scan from the
    // SAME position for only: [string, number] but ignoring "booger" (if it
    // was the first match), a simple resume would scan ahead who knows how
    // far looking only for "number", ignoring potential string matches (or
    // future "booger" matches that might be valid.)
    // So what we do: We execute two matchers, one resuming at the
    // position, but the second full matcher starting at the position after:
    // /--- resume first regex match here (for [number])
    // /---- full match here for [string, "booger", number]
    // vv
    // ...booger...
    // Which ever results in a match first is then used. So this 3-4 step
    // process essentially allows us to say "match at this position, excluding
    // a prior rule that was ignored".
    // 1. Match "booger" first, ignore. Also proves that [string] does non match.
    // 2. Resume matching for [number]
    // 3. Match at index + 1 for [string, "booger", number]
    // 4. If #2 and #3 result in matches, which came first?
    if (this.resumingScanAtSamePosition()) {
      if (result && result.index === this.lastIndex) ; else { // use the
      second matcher result
