`samples.collections.Arrays.CopyOfOperations.copyOf`
`LongArray.copyOf()`: `LongArray`
Returns new array which is a copy of the original array.
`FloatArray.copyOf()`: `FloatArray`
Returns new array which is a copy of the original array.
`DoubleArray.copyOf()`: `DoubleArray`
Returns new array which is a copy of the original array.
`BooleanArray.copyOf()`: `BooleanArray`
Returns new array which is a copy of the original array.
`CharArray.copyOf()`: `CharArray`
Returns new array which is a copy of the original array, resized to the given [newSize].
The copy is either truncated or padded at the end with zero values if necessary.
- If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize].
- If [newSize] is greater than the size of the original array, the extra elements in the copy array are filled with zero values.
`resizedPrimitiveCopyOf`
`ByteArray.copyOf(newSize: Int)`: `ByteArray`
Returns new array which is a copy of the original array, resized to the given [newSize].
The copy is either truncated or padded at the end with zero values if necessary.
- If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize].
- If [newSize] is greater than the size of the original array, the extra elements in the copy array are filled with zero values.
`resizedPrimitiveCopyOf`
`ShortArray.copyOf(newSize: Int)`: `ShortArray`
Returns new array which is a copy of the original array, resized to the given [newSize].
The copy is either truncated or padded at the end with zero values if necessary.
- If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize].
- If [newSize] is greater than the size of the original array, the extra elements in the copy array are filled with zero values.
`resizedPrimitiveCopyOf`
`IntArray.copyOf(newSize: Int)`: `IntArray`
Returns new array which is a copy of the original array, resized to the given [newSize].
The copy is either truncated or padded at the end with zero values if necessary.
- If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize].
- If [newSize] is greater than the size of the original array, the extra elements in the copy array are filled with zero values.
`resizedPrimitiveCopyOf`
`LongArray.copyOf(newSize: Int)`: `LongArray`
Returns new array which is a copy of the original array, resized to the given [newSize].
The copy is either truncated or padded at the end with zero values if necessary.
- If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize].
- If [newSize] is greater than the size of the original array, the extra elements in the copy array are filled with zero values.
`resizedPrimitiveCopyOf`
`FloatArray.copyOf(newSize: Int)`: `FloatArray`
Returns new array which is a copy of the original array, resized to the given [newSize].
The copy is either truncated or padded at the end with zero values if necessary.
- If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize].
- If [newSize] is greater than the size of the original array, the extra elements in the copy array are filled with zero values.
`resizedPrimitiveCopyOf`
`DoubleArray.copyOf(newSize: Int)`: `DoubleArray`
Returns new array which is a copy of the original array, resized to the given [newSize].
The copy is either truncated or padded at the end with `false` values if necessary.
- If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize].
- If [newSize] is greater than the size of the original array, the extra elements in the copy array are filled with `false` values.

`@sample samples.collections.Arrays.Transformations.associateArrayOfPrimitivesTo`

```

public inline fun <K, V, M : MutableMap<in K, in V>> CharArray.associateTo(destination: M, transform: (Char) -> Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

```

Returns a [Map] where keys are elements from the given array and values are produced by the [valueSelector] function applied to each element. If any two elements are equal, the last one gets added to the map. The returned map preserves the entry iteration order of the original array.

`@sample samples.collections.Collections.Transformations.associateWith`

```

@SinceKotlin("1.4")
public inline fun <K, V> Array<out K>.associateWith(valueSelector: (K) -> V): Map<K, V> {
    val result = LinkedHashMap<K, V>(mapCapacity(size).coerceAtLeast(16))
    return associateWithTo(result, valueSelector)
}

```

Returns a [Map] where keys are elements from the given array and values are produced by the [valueSelector] function applied to each element. If any two elements are equal, the last one gets added to the map. The returned map preserves the entry iteration order of the original array.

`@sample samples.collections.Collections.Transformations.associateWith`

```

@SinceKotlin("1.4")
@kotlin.internal.InlineOnly
public inline fun <V> ByteArray.associateWith(valueSelector: (Byte) -> V): Map<Byte, V> {
    val result = LinkedHashMap<Byte, V>(mapCapacity(size).coerceAtLeast(16))
    return associateWithTo(result, valueSelector)
}

```

Returns a [Map] where keys are elements from the given array and values are produced by the [valueSelector] function applied to each element. If any two elements are equal, the last one gets added to the map. The returned map preserves the entry iteration order of the original array.

`@sample samples.collections.Collections.Transformations.associateWith`

```

*public infix fun <R> FloatArray.zip(other: Array<out R>): List<Pair<Float, R>> {
    return zip(other) { t1, t2 -> t1 to t2 }
}

```

Returns a list of pairs built from the elements of this array and the [other] array with the same index. The returned list has length of the shortest collection.

`@sample samples.collections.Iterables.Operations.zipIterable`

```

*public infix fun <R> DoubleArray.zip(other: Array<out R>): List<Pair<Double, R>> {
    return zip(other) { t1, t2 -> t1 to t2 }
}

```

Returns a list of pairs built from the elements of this array and the [other] array with the same index. The returned list has length of the shortest collection.

`@sample samples.collections.Iterables.Operations.zipIterable`

```

*public infix fun <R> BooleanArray.zip(other: Array<out R>): List<Pair<Boolean, R>> {
    return zip(other) { t1, t2 -> t1 to t2 }
}

```

Returns a list of pairs built from the elements of this array and the [other] array with the same index. The returned list has length of the shortest collection.

`@sample samples.collections.Iterables.Operations.zipIterable`

```

*public infix fun <R> CharArray.zip(other: Array<out R>): List<Pair<Char, R>> {
    return zip(other) { t1, t2 -> t1 to t2 }
}

```

Returns a list of values built from the elements of this array and the [other] array with the same index using the provided [transform] function applied to each pair of elements. The returned list has length of the shortest collection.

`@sample samples.collections.Iterables.Operations.zipIterableWithTransform`

```

*public inline fun <T, R, V> Array<out T>.zip(other: Array<out R>, transform: (a: T, b: R) -> V): List<V> {
    val size = minOf(size, other.size)
    val list = ArrayList<V>(size)
    for (i in 0 until size) {
        list.add(transform(this[i], other[i]))
    }
    return list
}

```

Returns a list of values built from the elements of this array and the [other]

```

```

Groups elements of the original sequence by the key returned by the given [keySelector] function applied to each element and returns a map where each group key is associated with a list of corresponding elements.

The returned map preserves the entry iteration order of the keys produced from the original sequence.

The operation is `_terminal_`.

@sample

```

samples.collections.Collections.Transformations.groupBy

```

```

public inline fun <T, K> Sequence<T>.groupBy(keySelector: (T) -> K): Map<K, List<T>> {
    return groupByTo(LinkedHashMap<K, MutableList<T>>(), keySelector)
}

```

Groups values returned by the [valueTransform] function applied to each element of the original sequence by the key returned by the given [keySelector] function applied to the element and returns a map where each group key is associated with a list of corresponding values.

The returned map preserves the entry iteration order of the keys produced from the original sequence.

The operation is `_terminal_`.

@sample

```

samples.collections.Collections.Transformations.groupByKeysAndValues

```

```

public inline fun <T, K, V> Sequence<T>.groupBy(keySelector: (T) -> K, valueTransform: (T) -> V): Map<K, List<V>> {
    return groupByTo(LinkedHashMap<K, MutableList<V>>(), keySelector, valueTransform)
}

```

Groups elements of the original sequence by the key returned by the given [keySelector] function applied to each element and puts to the [destination] map each group key associated with a list of corresponding elements.

The operation is `_terminal_`.

@return The [destination] map.

The operation is `_terminal_`.

@sample

```

samples.collections.Collections.Transformations.groupBy

```

```

public inline fun <T, K, M : MutableMap<in K, MutableList<T>>> Sequence<T>.groupByTo(destination: M, keySelector: (T) -> K): M {

        val list = destination.getOrPut(key) { ArrayList<T>() }
        list.add(element)
    }
    return destination
}

```

Groups values returned by the [valueTransform] function applied to each element of the original sequence by the key returned by the given [keySelector] function applied to the element and puts to the [destination] map each group key associated with a list of corresponding values.

The operation is `_terminal_`.

@return The [destination] map.

The operation is `_terminal_`.

@sample

```

samples.collections.Collections.Transformations.groupByKeysAndValues

```

```

public inline fun <T, K, V, M : MutableMap<in K, MutableList<V>>> Sequence<T>.groupByTo(destination: M, keySelector: (T) -> K, valueTransform: (T) -> V): M {
    for (element in this) {
        val key = keySelector(element)
        val list = destination.getOrPut(key) { ArrayList<V>() }
        list.add(valueTransform(element))
    }
    return destination
}

```

Creates a [Grouping]

source from a sequence to be used later with one of group-and-fold operations using the specified [keySelector] function to extract a key from each element.

The operation is `_intermediate_` and `_stateless_`.

@sample

```

samples.collections.Grouping.groupingByEachCount

```

```

@SinceKotlin("1.1")
public inline fun <T, K> Sequence<T>.groupingBy(crossinline keySelector: (T) -> K): Grouping<T, K> {

}

```

Splits the original sequence into pair of lists, where `*first*` list contains elements for which [predicate] yielded ``true``, while `*second*` list contains elements for which [predicate] yielded ``false``.

The operation is `_terminal_`.

```

@sample samples.collections.Sequences.Transformations.partition
public inline fun <T>
Sequence<T>.partition(predicate: (T) -> Boolean): Pair<List<T>, List<T>> {
    val first = ArrayList<T>()
    val second = ArrayList<T>()
    for (element in this) {
        if (predicate(element))
            first.add(element)
        else
            second.add(element)
    }
    return Pair(first, second)
}

```

Returns a sequence containing all elements of the original sequence and then the given [element].

The operation is `_intermediate_` and `_stateless_`.

```

public operator fun <T> Sequence<T>.plus(element: T): Sequence<T> {
    return sequenceOf(this, sequenceOf(element)).flatten()
}

```

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] array.

Note that the source sequence and the array being added are iterated only when an ``iterator`` is requested from the resulting sequence. Changing any of them between successive calls to ``iterator`` may affect the result.

The operation is `_intermediate_` and `_stateless_`.

```

public operator fun <T> Sequence<T>.plus(elements:
Array<out T>): Sequence<T> {
    return this.plus(elements.asList())
}

```

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] collection.

Note that the source sequence and the collection being added are iterated only when an ``iterator`` is requested from the resulting sequence. Changing any of them between successive calls to ``iterator`` may affect the result.

The operation is `_intermediate_` and `_stateless_`.

```

public operator fun <T> Sequence<T>.plus(elements:
Iterable<T>): Sequence<T> {
    return sequenceOf(this, elements.asSequence()).flatten()
}

```

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] sequence.

Note that the source sequence and the sequence being added are iterated only when an ``iterator`` is requested from the resulting sequence. Changing any of them between successive calls to ``iterator`` may affect the result.

The operation is `_intermediate_` and `_stateless_`.

```

public operator fun <T>
Sequence<T>.plus(elements: Sequence<T>): Sequence<T> {
    return sequenceOf(this,
elements).flatten()
}

```

Returns a sequence containing all elements of the original sequence and then the given [element].

The operation is `_intermediate_` and `_stateless_`.

```

@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.plusElement(element: T): Sequence<T> {
    return plus(element)
}

```

Returns a sequence of snapshots of the window of the given [size] sliding along this sequence with the given [step], where each

- snapshot is a list.
- Several last lists may have fewer elements than the given [size].
- Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements to take in each window

@param step the number of elements to move the window forward by on an each step, by default 1

@param partialWindows controls whether or not to keep partial windows in the end if any, by default ``false`` which means partial windows won't be preserved

@sample

```

@sample samples.collections.Sequences.Transformations.takeWindows
@SinceKotlin("1.2")
public fun <T>
Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<List<T>> {
    return windowedSequence(size, step, partialWindows, reuseBuffer = false)
}

```

Returns a sequence of results of applying the given [transform] function to an each list representing a view over the window of the given [size]

```

*  

public fun <T> Sequence<T>.joinToString(separator: CharSequence = "|", prefix: CharSequence = "\n",  

postfix: CharSequence = "\n", limit: Int = -1, truncated: CharSequence = "...", transform: ((T) -> CharSequence)? =  

null): String {  

    return joinTo(StringBuilder(), separator, prefix, postfix, limit, truncated,  

    transform).toString()

```

character and the character itself

```

public inline fun <R> CharSequence.mapIndexed(transform: (index: Int, Char) -> R): List<R> {
    return mapIndexedTo(ArrayList<R>(length),
        transform)
}

```

Returns a list containing only the non-null results of applying the given [transform] function to each character and its index in the original char sequence.

@param [transform] function that takes the index of a character and the character itself and returns the result of the transform applied to the character.

```

public inline fun <R : Any> CharSequence.mapIndexedNotNull(transform: (index: Int, Char) -> R?): List<R> {
    return mapIndexedNotNullTo(ArrayList<R>(), transform)
}

```

Applies the given [transform] function to each character and its index in the original char sequence and appends only the non-null results to the given [destination].

@param [transform] function that takes the index of a character and the character itself and returns the result of the transform applied to the character.

```

public inline fun <R : Any, C : MutableCollection<in R>> CharSequence.mapIndexedNotNullTo(destination: C, transform: (index: Int, Char) -> R?): C {
    forEachIndexed { index, element -> transform(index, element)?.let { destination.add(it) } }
    return destination
}

```

Applies the given [transform] function to each character and its index in the original char sequence and appends the results to the given [destination].

@param [transform] function that takes the index of a character and the character itself and returns the result of the transform applied to the character.

```

public inline fun <R, C : MutableCollection<in R>> CharSequence.mapIndexedTo(destination: C, transform: (index: Int, Char) -> R): C {
    var index = 0
    for (item in this)
        destination.add(transform(index++, item))
    return destination
}

```

Returns a list containing only the non-null results of applying the given [transform] function to each character in the original char sequence.

@sample samples.collections.Collections.Transformations.mapNotNull

```

public inline fun <R : Any> CharSequence.mapNotNull(transform: (Char) -> R?): List<R> {
    return mapNotNullTo(ArrayList<R>(), transform)
}

```

Applies the given [transform] function to each character in the original char sequence and appends only the non-null results to the given [destination].

```

public inline fun <R : Any, C : MutableCollection<in R>> CharSequence.mapNotNullTo(destination: C, transform: (Char) -> R?): C {
    forEach { element -> transform(element)?.let { destination.add(it) } }
    return destination
}

```

Applies the given [transform] function to each character of the original char sequence and appends the results to the given [destination].

```

public inline fun <R, C : MutableCollection<in R>> CharSequence.mapTo(destination: C, transform: (Char) -> R): C {
    for (item in this)
        destination.add(transform(item))
    return destination
}

```

Returns a lazy [Iterable] that wraps each character of the original char sequence into an [IndexedValue] containing the index of that character and the character itself.

```

public fun CharSequence.withIndex(): Iterable<IndexedValue<Char>> {
    return IndexingIterable { iterator() }
}

```

Returns `true` if all characters match the given [predicate].

Note that if the char sequence contains no characters, the function returns `true` because there are no characters in it that do not match the predicate. See a more detailed explanation of this logic concept in [Vacuous truth](https://en.wikipedia.org/wiki/Vacuous_truth) article.

@sample samples.collections.Collections.Aggregates.all

```

public inline fun CharSequence.all(predicate: (Char) -> Boolean): Boolean {
    for (element in this) if (!predicate(element)) return false

@Retention(AnnotationRetention.BINARY)
@Since
Kotlin("1.4")
public annotation class ExperimentalJsExport
 * Exports top-level declaration on JS
platform.
 * Compiled module exposes declarations that are marked with this annotation without name
mangling.
 * This annotation can be applied to either files or top-level declarations.
 * It is currently
prohibited to export the following kinds of declarations:
 * `expect` declarations
 * inline functions
with reified type parameters
 * suspend functions
 * secondary constructors without `@JsName`
 *
extension properties
 * enum classes
 * annotation classes
 * Signatures of exported declarations must
only contain "exportable" types:
 * `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`,
`Double`
 * `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
 *
`Array<exportable-type>`
 * Function types with exportable parameters and return types
 * `external` or
`@JsExport` classes and interfaces
 * Nullable counterparts of types above
 * Unit return type. Must not be
nullable
 * This annotation is experimental, meaning that restrictions mentioned above are subject to change.

annotation class library(public val name: String = \\\")\n\n\n@Target(CLASS)\n\n\ninternal annotation class
marker\n\n\n/**\n * Gives a declaration (a function, a property
or a class) specific name in JavaScript.\n *^\n * This may be useful in the following cases:\n *^\n * * There are two
functions for which the compiler gives same name in JavaScript, you can\n *    mark one with `@JsName(...)` to
prevent the compiler from reporting error.\n *^\n * * You are writing a JavaScript library in Kotlin. The compiler
produces mangled names\n *    for functions with parameters, which is unnatural for usual JavaScript developer.\n *^\n
* You can put `@JsName(...)` on functions you want to be available from JavaScript.\n *^\n * * For some reason you
want to rename declaration, e.g. there's common term in JavaScript\n *    for a concept provided by the declaration,
which is uncommon in Kotlin.\n *^\n * Example:\n *^\n * ``` kotlin\n * class Person(val name: String) {\n *    fun
hello() {\n *        println(\\"Hello $name!\")\n *    }\n *^\n *    @JsName(\\"helloWithGreeting\\")\n *    fun
hello(greeting: String) {\n *        println(\\"$greeting $name!\")\n *    }\n *^\n * }\n *^\n * ```\n *^\n * @property name the name which compiler uses both for declaration itself and for all references to
the declaration.\n *^\n *    It's required to denote a valid JavaScript identifier.\n *^\n
*^\n\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR,
PROPERTY_GETTER, PROPERTY_SETTER)\npublic actual annotation class JsName(actual val name:
String)\n\n\n/**\n * Denotes an `external` declaration that must be imported from native JavaScript library.\n *^\n
* The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n *^\n
it will import the declaration via the `require(...)` function.\n *^\n * The annotation can be used on top-level external
declarations (classes, properties, functions) and files.\n *^\n * In case of file (which can't be `external`) the following rule
applies: all the declarations in\n *^\n * the file must be `external`. By applying `@JsModule(...)` on a file you tell the
compiler to import a
JavaScript object\n *^\n * that contain all the declarations from the file.\n *^\n * Example:\n *^\n * ``` kotlin\n *
@JsModule(\\"jquery\\")\n * external abstract class JQuery() {\n *    // some declarations here\n * }\n *^\n *
@JsModule(\\"jquery\\")\n * external fun JQuery(element: Element): JQuery\n *^\n * ```\n *^\n * @property import name
of a module to import declaration from.\n *^\n *    It is not interpreted by the Kotlin compiler, it's passed as is

```

directly to the target module system.
`@see JsNonModule`
`@Retention(AnnotationRetention.BINARY)`
`@Target(CLASS, PROPERTY, FUNCTION, FILE)`
 public
 annotation class JsModule(val import: String)
 Denotes an `external` declaration that can be used without
 module system.
 By default, an `external` declaration is available regardless your target module system.
 However, by applying [JsModule] annotation you can make a declaration unavailable to `plain` module system.
 Some JavaScript libraries are distributed both as
 a standalone downloadable piece of JavaScript and as a module available
 as an npm package.
 To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.
 For example:

```

kotlin
@JsModule("jquery")
@JsNonModule
@JsName("$")
external
abstract class JQuery() {
    // some declarations here
}
@JsModule("jquery")
@JsNonModule
@JsName("$")
external fun JQuery(element: Element): JQuery

```

`@see JsModule`
`@Retention(AnnotationRetention.BINARY)`
`@Target(CLASS, PROPERTY, FUNCTION, FILE)`
 public
 annotation class JsNonModule
 Adds prefix to `external` declarations in a source file.
 JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.
 The compiler turns references to `external` declarations either to plain unprefixed names (in case of `plain` modules) or to plain imports.
 However,
 if a JavaScript library provides its declarations in packages, you won't be satisfied with this.
 You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation.
 Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.
 Example:

```

@file:JsQualifier("my.jsPackageName")
package
some.kotlinPackage
external fun foo(x: Int)
external fun bar(): String

```

`@property value`
 the qualifier to add to the declarations in the generated code.
 It must be a sequence of valid JavaScript identifiers separated by the `.` character.
 Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.$.f`
`@see JsModule`
`@Retention(AnnotationRetention.BINARY)`
`@Target(AnnotationTarget.FILE)`
 public
 annotation class JsQualifier(val value: String)
 Exports top-level declaration
 on JS platform.
 Compiled module exposes declarations that are marked with this annotation without name mangling.
 This annotation can be applied to either files or top-level declarations.
 It is currently prohibited to export the following kinds of declarations:
 * `expect` declarations
 * inline functions with reified type parameters
 * suspend functions
 * secondary constructors without `@JsName`
 * extension properties
 * enum classes
 * annotation classes
 Signatures of exported declarations must only contain "exportable" types:
 * `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`,
 `Double`
 * `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
 * `Array<exportable-type>`
 * Function types with exportable parameters and return types
 * `external` or `@JsExport` classes and interfaces
 * Nullable counterparts of types above
 * Unit return type. Must not be nullable
 This annotation is experimental, meaning that restrictions mentioned above are subject to change.
`@ExperimentalJsExport`
`@Retention(AnnotationRetention.BINARY)`
`@Target(CLASS, PROPERTY, FUNCTION, FILE)`
`@SinceKotlin("1.3")`
 public actual annotation class JsExport
 Forces a top-level property to be initialized eagerly, opposed to lazily on the first access to file and/or property.
`@ExperimentalStdlibApi`
`@Retention(AnnotationRetention.BINARY)`
`@Target(AnnotationTarget.PROPERTY)`
`@SinceKotlin("1.6")`
`@Deprecated("This annotation is a temporal migration assistance and may be removed in the future releases, please consider filing an issue about the case where it is needed")`
 public annotation class EagerInitialization
