annotation class marker\n\n/**\n * Gives a declaration (a function, a property or a class) specific name in
JavaScript.\n * This may be useful in the following cases:\n * * There are two functions for which the
compiler gives same name in JavaScript, you can\n * mark one with `@JsName(...)` to prevent
the compiler from reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces
mangled names\n * for functions with parameters, which is unnatural for usual JavaScript developer.\n * You
can put `@JsName(...)` on functions you want to be available from JavaScript.\n * * For some reason you want to
rename declaration, e.g. there's common term in JavaScript\n * for a concept provided by the declaration, which
is uncommon in Kotlin.\n * Example:\n * ```\n * kotlin\n * class Person(val name: String) {\n *     fun hello()
{\n *         println("Hello $name!")\n *     }\n *     @JsName("helloWithGreeting")\n *     fun hello(greeting:
String) {\n *         println("$greeting $name!")\n *     }\n * }\n * ```\n * @property name the name which
compiler uses both for declaration itself and for all references to the declaration.\n * It's required to denote a
valid JavaScript identifier.\n * */\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS,
FUNCTION, PROPERTY, CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)\n\npublic actual
annotation class JsName(actual val name: String)\n\n/**\n * Denotes an `external` declaration that must be imported
from native JavaScript library.\n * The compiler produces the code relevant for the target module system, for
example, in case of CommonJS,\n * it will import the declaration via the `require(...)` function.\n * The
annotation can be used on top-level external declarations (classes, properties, functions) and files.\n * In case of file
(which can't be `external`) the following rule applies: all the declarations in\n * the file must be `external`. By
applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object\n * that contain all the
declarations from the file.\n * Example:\n * ```\n * kotlin\n * @JsModule("jquery")\n * external abstract class
jQuery() {\n *     // some declarations here\n * }\n * @JsModule("jquery")\n * external fun jQuery(element: Element):
jQuery\n * ```\n * @property import name of a module to import
declaration from.\n * It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module
system.\n * @see JsNonModule\n * */\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS,
PROPERTY, FUNCTION, FILE)\n\npublic annotation class JsModule(val import: String)\n\n/**\n * Denotes an
`external` declaration that can be used without module system.\n * By default, an `external` declaration is
available regardless your target module system.\n * However, by applying [JsModule] annotation you can make a
declaration unavailable to *plain* module system.\n * Some JavaScript libraries are distributed both as a standalone
downloadable piece of JavaScript and as a module available\n * as an npm package.\n * To tell the Kotlin compiler
to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n * For example:\n * ```\n *
kotlin\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external abstract class
jQuery() {\n *     // some declarations here\n * }\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external fun jQuery(element: Element):
jQuery\n * ```\n * @see JsModule\n * */\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\n\npublic
annotation class JsNonModule\n\n/**\n * Adds prefix to `external` declarations in a source file.\n * JavaScript

```

does not have concept of packages (namespaces). They are usually emulated by nested objects. The compiler turns references to `external` declarations either to plain unprefix names (in case of `plain` modules) or to plain imports. However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this. You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)`

annotation. Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations. Example: `@file:JsQualifier("my.jsPackageName") package some.kotlinPackage external fun foo(x: Int) external fun bar(): String` the qualifier to add to the declarations in the generated code. It must be a sequence of valid JavaScript identifiers separated by the `.` character. Examples of valid qualifiers are: `foo`, `bar.Baz`, `\_.\$.f`

`@see JsModule @Retention(AnnotationRetention.BINARY) @Target(AnnotationTarget.FILE) public annotation class JsQualifier(val value: String) Exports top-level declaration on JS platform. Compiled module exposes declarations that are marked with this annotation without name mangling. This annotation can be applied to either files or top-level declarations. It is currently prohibited to export the following kinds of declarations: `expect` declarations, inline functions with reified type parameters, suspend functions, secondary constructors without `@JsName`, extension properties, enum classes, annotation classes. Signatures of exported declarations must only contain "exportable" types: `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`, `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`, `Array<exportable-type>`, Function types with exportable parameters and return types, `external` or `@JsExport` classes and interfaces, Nullable counterparts of types above, Unit return type. Must not be nullable. This annotation is experimental, meaning that restrictions mentioned above are subject to change.`

`@ExperimentalJsExport @Retention(AnnotationRetention.BINARY) @Target(CLASS, PROPERTY, FUNCTION, FILE) @SinceKotlin("1.3") public actual annotation class JsExport` Forces a top-level property to be initialized eagerly, opposed to lazily on the first access to file and/or property.  
`@ExperimentalStdlibApi @Retention(AnnotationRetention.BINARY) @Target(AnnotationTarget.PROPERTY) @SinceKotlin("1.6") @Deprecated("This annotation is a temporal migration assistance and may be removed in the future releases, please consider filing an issue about the case where it is needed") public annotation class EagerInitialization` Copyright 2010-2018 JetBrains s.r.o. and Kotlin Programming Language contributors. * and its call sites should accept the experimental aspect of it either

```

the type argument of the resulting sequence is inferred to `String` from the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence].

\* Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

```

@Target(VALUE_PARAMETER, FUNCTION, PROPERTY)
@Retention(AnnotationRetention.BINARY)
@SinceKotlin("1.3")
@ExperimentalTypeInference
public annotation class BuilderInference

```

\* Enables overload selection based on the type of the value returned from lambda argument.

\* When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter.

\* Example:

```

@OverloadResolutionByLambdaReturnType
fun create(intProducer: () -> Int): Int
fun create(doubleProducer: () -> Double): Double
val newValue = create { 3.14 }

```

\* The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function.

\* This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported.

\* Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

```

@Target(FUNCTION)
@Retention(AnnotationRetention.BINARY)
@SinceKotlin("1.4")
@ExperimentalTypeInference
public annotation class OverloadResolutionByLambdaReturnType

```

\* Copyright 2010-2018 JetBrains s.r.o. and Kotlin Programming Language contributors.

package kotlin
import kotlin.annotation.AnnotationTarget
import kotlin.internal.RequireKotlin
import kotlin.internal.RequireKotlinVersionKind

```

\* The experimental multiplatform support API marker.

\* Any usage of a declaration annotated with `@ExperimentalMultiplatform` must be accepted either by annotating that usage with the [OptIn] annotation, e.g. `@OptIn(ExperimentalMultiplatform::class)`, or by using the compiler argument `-opt-in=kotlin.ExperimentalMultiplatform`.

```

@RequiresOptIn
@MustBeDocumented
@Target(CLASS, ANNOTATION_CLASS, PROPERTY, FIELD, LOCAL_VARIABLE, VALUE_PARAMETER, CONSTRUCTOR, FUNCTION, PROPERTY_GETTER, PROPERTY_SETTER, TYPEALIAS)
@Retention(AnnotationRetention.BINARY)
@RequireKotlin("1.2.50", versionKind = RequireKotlinVersionKind.COMPILER_VERSION)
public annotation class ExperimentalMultiplatform

```

\* Marks an expected annotation class that it isn't required to have actual counterparts in all platforms.

\* This annotation is only applicable to `expect` annotation classes in multi-platform projects and marks that class as "optional".

\* Optional expected class is allowed to have no corresponding actual class on the platform. Optional annotations can only be used to annotate something, not as types in signatures. If an optional annotation has no corresponding actual class on a platform, the annotation entries where it's used are simply erased when compiling code on that platform.

\* Note: this annotation is experimental, see [ExperimentalMultiplatform] on how to opt-in for it.

```

@Target(ANNOTATION_CLASS)
@Retention(AnnotationRetention.BINARY)
@ExperimentalMultiplatform
@RequireKotlin("1.2.50", versionKind = RequireKotlinVersionKind.COMPILER_VERSION)

\* Signals that the annotated annotation class is a marker of an API that requires an explicit opt-in.

\* Call sites of any declaration annotated with that marker should opt in to the API either by using [OptIn], or by being annotated with that marker themselves, effectively causing further propagation of the

opt-in requirement.  
 \* This class requires opt-in itself and can only be used with the compiler argument `-opt-in=kotlin.RequiresOptIn``.  
 \* @property message message to be reported on usages of API without an explicit opt-in, or empty string for the default message.  
 \* The default message is: `"This declaration is experimental and its usage should be marked with 'Marker' or '@OptIn(Marker::class)'"`, where ``Marker`` is the opt-in requirement marker.  
 \* @property level specifies how usages of API without an explicit opt-in are reported in code.

    package kotlin.coroutines
    import kotlin.coroutines.CoroutineContext.Element
    import
    kotlin.coroutines.CoroutineContext.Key

    * Base class for [CoroutineContext.Element] implementations.
    *
    @SinceKotlin("1.3")
    public abstract class AbstractCoroutineContextElement(
    public
    override val key: Key<*>) : Element {

    * Base class for [CoroutineContext.Key] associated with
    polymorphic [CoroutineContext.Element] implementation.
    * Polymorphic element implementation implies
    delegating its [get][Element.get] and [minusKey][Element.minusKey]
    to [getPolymorphicElement] and [minusPolymorphicKey]
    respectively.
    * Polymorphic elements can be extracted from the coroutine context
    using both element key and its supertype key.
    * Example of polymorphic elements:
    * ```
    * open class
    BaseElement : CoroutineContext.Element {
    *     companion object Key : CoroutineContext.Key<BaseElement>
    *     override val key: CoroutineContext.Key<*> get() = Key
    *     // It is important to use getPolymorphicKey and
    minusPolymorphicKey
    *     override fun <E : CoroutineContext.Element> get(key: CoroutineContext.Key<E>):
    E? = getPolymorphicElement(key)
    *     override fun minusKey(key: CoroutineContext.Key<*>):
    CoroutineContext = minusPolymorphicKey(key)
    }

    * class DerivedElement : BaseElement() {
    *     companion object Key :
    AbstractCoroutineContextKey<BaseElement, DerivedElement>(BaseElement, { it as? DerivedElement })
    * }

    * // Now it is possible to query both `BaseElement` and `DerivedElement`
    * someContext[BaseElement] // Returns
    BaseElement?, non-null both for BaseElement and DerivedElement instances
    * someContext[DerivedElement] //
    Returns DerivedElement?, non-null only for DerivedElement instance
    * ```
    * @param B base class of a
    polymorphic element
    * @param baseKey an instance of base key
    * @param E element type associated with the
    current key
    * @param safeCast a function that can safely cast abstract [CoroutineContext.Element] to the concrete
    [E] type
    *     and return the element if it is a subtype of [E] or `null` otherwise.
    *
    *
    @SinceKotlin("1.3")
    @ExperimentalStdlibApi
    public abstract class AbstractCoroutineContextKey<B :

kotlin.coroutines.intrinsics\n\nimport kotlin.contracts.*\nimport kotlin.coroutines.*\nimport
kotlin.internal.InlineOnly\n\n/**\n * Obtains the current continuation instance inside suspend functions and either
suspends\n * currently running

```

coroutine or returns result immediately without suspension. If the [block] returns the special [COROUTINE\_SUSPENDED] value, it means that suspend function did suspend the execution and will not return any result immediately. In this case, the [Continuation] provided to the [block] shall be resumed by invoking [Continuation.resumeWith] at some moment in the future when the result becomes available to resume the computation. Otherwise, the return value of the [block] must have a type assignable to [T] and represents the result of this suspend function. It means that the execution was not suspended and the [Continuation] provided to the [block] shall not be invoked. As the result type of the [block] is declared as `Any?` and cannot be correctly type-checked, its proper return type remains on the conscience of the suspend function's author. Invocation of [Continuation.resumeWith] resumes coroutine directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the coroutine's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. [Continuation.intercepted] can be used to acquire the intercepted continuation. Note that it is not recommended to call either [Continuation.resume] nor [Continuation.resumeWithException] functions synchronously in the same stackframe where suspension function is run. Use [suspendCoroutine] as a safer way to obtain current continuation instance.

```

@SinceKotlin("1.3")@InlineOnly@Suppress("UNUSED_PARAMETER",
"RedundantSuspendModifier")
public suspend inline fun <T>
suspendCoroutineUninterceptedOrReturn(crossinline block: (Continuation<T>) -> Any?): T {
    contract {
        callsInPlace(block, InvocationKind.EXACTLY_ONCE)
    }
    throw NotImplementedError("Implementation of
suspendCoroutineUninterceptedOrReturn is intrinsic")
}

```

This value is used as a return value of [suspendCoroutineUninterceptedOrReturn] `block` argument to state that the execution was suspended and will not return any result immediately. Note: this value should not be used in general code. Using it outside of the context of `suspendCoroutineUninterceptedOrReturn` function return value (including, but not limited to, storing this value in other properties, returning it from other functions, etc) can lead to unspecified behavior of the code. It is implemented as property with getter to avoid ProGuard <clinit> problem with multifile IntrinsicKt class

```

@SinceKotlin("1.3")
public val COROUTINE_SUSPENDED:
Any get() = CoroutineSingletons.COROUTINE_SUSPENDED

```

Using enum here ensures two important properties:

1. It makes SafeContinuation serializable with all kinds of serialization frameworks (since all of them natively support enums)
2. It improves debugging experience, since you clearly see toString() value of those objects and what package they come from

```

@SinceKotlin("1.3")
@PublishedApi // This class is
Published API via serialized representation of SafeContinuation, don't rename/move
internal enum class
CoroutineSingletons { COROUTINE_SUSPENDED, UNDECIDED, RESUMED }

```

kotlin.coroutines.*\nimport kotlin.coroutines.intrinsics.*\nimport
kotlin.native.concurrent.SharedImmutable\n\n/**\n * Defines deep recursive function that keeps its stack on the
heap,\n * which allows very deep recursive computations that do not use the actual call stack.\n * To initiate a call to
this deep recursive function use its [invoke] function.\n * As a rule of thumb, it should be used if recursion goes
deeper than a thousand calls.\n *\n * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a
result of type [R].\n * The [block] of code defines the body of a recursive function. In this block\n *
[callRecursive][DeepRecursiveScope.callRecursive]
function can be used to make a recursive call\n * to the declared function. Other instances of
[DeepRecursiveFunction] can be called\n * in this scope with `callRecursive` extension, too.\n *\n * For example,
take a look at the following recursive tree class and a deeply\n * recursive instance of this tree with 100K nodes:\n
*\n * ```\n * class Tree(val left: Tree? = null, val right: Tree? = null)\n * val deepTree = generateSequence(Tree()) {
Tree(it) }.take(100_000).last()\n * ```\n * A regular recursive function can be defined to compute a depth of a
tree:\n * ```\n * fun depth(t: Tree?): Int =\n *     if (t == null) 0 else max(depth(t.left), depth(t.right)) + 1\n *
println(depth(deepTree)) // StackOverflowError\n * ```\n * If this `depth` function is called for a `deepTree` it
produces `StackOverflowError` because of deep recursion.\n * However, the `depth` function can be rewritten using
`DeepRecursiveFunction` in the following way, and then\n * it successfully computes
[depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n * ```\n * val depth =
DeepRecursiveFunction<Tree?, Int> { t ->\n *     if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * ```\n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.\n * ```\n * val mutualRecursion = object {\n *     val even:
DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else
odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1\n *     }\n *     val odd: DeepRecursiveFunction<Tree?,
Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else even.callRecursive(t.left) +
even.callRecursive(t.right)\n *     }\n * }\n * ```\n *
@param [T] the function parameter type.\n * @param [R] the function result type.\n * @param block the function
body.\n * @SinceKotlin("1.7")\n * @WasExperimental(ExperimentalStdlibApi::class)\n * public class
DeepRecursiveFunction<T, R>(\n     internal val block: suspend DeepRecursiveScope<T, R>.(T) -> R)\n }\n\n/**\n *
Initiates a call to this deep recursive function, forming a root of the call tree.\n *\n * This operator should not be
used from inside of [DeepRecursiveScope] as it uses the call stack slot for\n * initial recursive invocation. From
inside of [DeepRecursiveScope] use\n * [callRecursive][DeepRecursiveScope.callRecursive].\n

```

```

cases:  $\sqrt{x}$  is NaN when  $x < 0$  or  $x$  is NaN

`public expect fun sqrt(x: Double): Double`  
 Computes Euler's number  $e$  raised to the power of the value  $[x]$ .

Special cases:  $e^{\text{NaN}}$  is NaN,  $e^{+\text{Inf}}$  is  $+\text{Inf}$ ,  $e^{-\text{Inf}}$  is  $0.0$

`public expect fun exp(x: Double): Double`  
 Computes  $\exp(x) - 1$ .

This function can be implemented to produce more precise result for  $[x]$  near zero.

Special cases:  $\exp(\text{NaN})$  is NaN,  $\exp(+\text{Inf})$  is  $+\text{Inf}$ ,  $\exp(-\text{Inf})$  is  $-1.0$

`public expect fun expm1(x: Double): Double`  
 Computes the logarithm of the value  $[x]$  to the given  $[\text{base}]$ .

Special cases:  $\log(x, b)$  is NaN if either  $x$  or  $b$  are NaN,  $\log(x, b)$  is NaN when  $x < 0$  or  $b \leq 0$  or  $b == 1.0$ ,  $\log(+\text{Inf}, +\text{Inf})$  is NaN,  $\log(+\text{Inf}, b)$  is  $+\text{Inf}$  for  $b > 1$  and  $-\text{Inf}$  for  $b < 1$ ,  $\log(0.0, b)$  is  $-\text{Inf}$  for  $b > 1$  and  $+\text{Inf}$  for  $b > 1$

See also logarithm functions for common fixed bases:  $[\ln]$ ,  $[\log10]$  and  $[\log2]$ .

`public expect fun log(x: Double, base: Double): Double`  
 Computes the natural logarithm (base  $E$ ) of the value  $[x]$ .

Special cases:  $\ln(\text{NaN})$  is NaN,  $\ln(x)$  is NaN when  $x < 0.0$ ,  $\ln(+\text{Inf})$  is  $+\text{Inf}$ ,  $\ln(0.0)$  is  $-\text{Inf}$

`public expect fun ln(x: Double): Double`  
 Computes the common logarithm (base 10) of the value  $[x]$ .

@see  $[\ln]$  function for special cases.

`public expect fun log10(x: Double): Double`  
 Computes the binary logarithm (base 2) of the value  $[x]$ .

@see  $[\ln]$  function for special cases.

`public expect fun log2(x: Double): Double`  
 Computes  $\ln(x + 1)$ .

This function can be implemented to produce more precise result for  $[x]$  near zero.

Special cases:  $\ln1p(\text{NaN})$  is NaN,  $\ln1p(x)$  is NaN where  $x < -1.0$ ,  $\ln1p(-1.0)$  is  $-\text{Inf}$ ,  $\ln1p(+\text{Inf})$  is  $+\text{Inf}$

@see  $[\ln]$  function, @see  $[\expm1]$  function

`public expect fun ln1p(x: Double): Double`  
 Rounds the given value  $[x]$  to an integer towards positive infinity.

@return the smallest double value that is greater than or equal to the given value  $[x]$  and is a mathematical integer.

Special cases:  $\text{ceil}(x)$  is  $x$  where  $x$  is NaN or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

`public expect fun ceil(x: Double): Double`  
 Rounds the given value  $[x]$  to an integer towards negative infinity.

@return the largest double value that is smaller than or equal to the given value  $[x]$  and is a mathematical integer.

Special cases:  $\text{floor}(x)$  is  $x$  where  $x$  is NaN or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

`public expect fun floor(x: Double): Double`  
 Rounds the given value  $[x]$  to an integer towards zero.

@return the value  $[x]$  having its fractional part truncated.

Special cases:  $\text{truncate}(x)$  is  $x$  where  $x$  is NaN or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

`public expect fun truncate(x: Double): Double`  
 Rounds the given value  $[x]$  towards the closest integer with ties rounded towards even integer.

Special cases:  $\text{round}(x)$  is  $x$  where  $x$  is NaN or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

`public expect fun round(x: Double): Double`  
 Returns the absolute value of the given value  $[x]$ .

Special cases:  $\text{abs}(\text{NaN})$  is NaN

@see `absoluteValue` extension property for `[Double]`

`public expect fun abs(x: Double): Double`  
 Returns the sign of the given value  $[x]$ :  $-1.0$  if the value is negative, zero if the value is zero,  $1.0$  if the value is positive

Special case:  $\text{sign}(\text{NaN})$  is NaN

`public expect fun sign(x: Double): Double`  
 Returns the smaller of two values.

If either value is NaN, then the result is NaN.

`public expect fun min(a: Double, b: Double): Double`  
 Returns the greater of two values.

If either value is NaN, then the result is NaN.

`public expect fun max(a: Double, b: Double): Double`

Extensions

Raises this value to the power  $[x]$ .

Special cases:  $b.\text{pow}(0.0)$  is  $1.0$ ,  $b.\text{pow}(1.0) == b$ ,  $b.\text{pow}(\text{NaN})$  is NaN,  $\text{NaN}.\text{pow}(x)$  is NaN for  $x \neq 0.0$ ,  $b.\text{pow}(\text{Inf})$  is NaN for  $\text{abs}(b) == 1.0$ ,  $b.\text{pow}(x)$  is NaN for  $b < 0$  and  $x$  is finite and not an integer

`public expect fun Double.pow(x: Double): Double`  
 Raises this value to the integer power  $[n]$ .

See the other overload of `[pow]` for details.

`public expect fun Double.pow(n: Int): Double`  
 Returns the absolute

value of this value.  
`* Special cases:`  
`- NaN.absoluteValue` is `NaN``  
`@see abs function`  
`* Since Kotlin("1.2")\npublic expect val Double.absoluteValue: Double`  
`* Returns the sign of this value:`  
`- -1.0` if the value is negative,`  
`- zero if the value is zero,`  
`- 1.0` if the value is positive`  
`* Special case:`  
`- NaN.sign` is `NaN``  
`* Since Kotlin("1.2")\npublic expect val Double.sign: Double`  
`* Returns this value with the sign bit same as of the [sign] value.`  
`* If [sign] is `NaN` the sign of the result is undefined.`  
`* Since Kotlin("1.2")\npublic expect fun Double.withSign(sign: Double): Double`  
`* Returns this value with the sign bit same as of the [sign] value.`  
`* Since Kotlin("1.2")\npublic expect fun Double.withSign(sign: Int): Double`  
`* Returns the ulp (unit in the last place) of this value.`  
`* An ulp is a positive distance between this value and the next nearest [Double] value larger in magnitude.`  
`* Special Cases:`  
`- NaN.ulp` is `NaN``  
`- x.ulp` is `+Inf` when `x` is `+Inf` or `-Inf``  
`- 0.0.ulp` is `Double.MIN_VALUE``  
`* Since Kotlin("1.2")\npublic expect val Double.ulp: Double`  
`* Returns the [Double] value nearest to this value in direction of positive infinity.`  
`* Since Kotlin("1.2")\npublic expect fun Double.nextUp(): Double`  
`* Returns the [Double] value nearest to this value in direction of negative infinity.`  
`* Since Kotlin("1.2")\npublic expect fun Double.nextDown(): Double`  
`* Returns the [Double] value nearest to this value in direction from this value towards the value [to].`  
`* Special cases:`
