Returns a [Map] containing the elements from the given collection indexed
by the key
returned from [keySelector] function applied to each element.
If any two elements would
have the same key returned by [keySelector] the last one gets added to the map.
The returned map preserves

Returns a [Map] containing
the values provided by [valueTransform] and indexed by [keySelector] functions applied to elements of the given
collection.
If any two elements would have the same key returned by [keySelector] the last one gets added
to the map.

samples.collections.Collections.Transformations.associateTo

public inline fun <T, K,

Iterable<T>.associateTo(destination: M, transform: (T) -> Pair<K, V>): M {
    for (element in this) {
destination += transform(element)
    }
    return destination
}

Returns a
[Map] where keys are elements from the given collection and values are
produced by the [valueSelector]
function
applied to each element.
If any two elements are equal, the last one gets added to the map.
The
returned map preserves the entry iteration order of the original collection.

    val result = LinkedHashMap<K,
V>(mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16))
    return associateWithTo(result,
valueSelector)
}

Populates and returns the [destination] mutable map with key-value pairs for each
element of the given collection,
where key is the element itself and value is provided by the [valueSelector]
function applied to that key.
If any two elements are equal, the last one overwrites the former value in the
map.

}

Populates and returns the [destination] mutable map with key-value pairs, where key is provided by the [keySelector] function applied to each element of the given sequence and value is the element itself.
If any two elements would have the same key returned by [keySelector] the last one gets added to the map.
The operation is _terminal_.

Populates and returns the [destination] mutable map with key-value pairs, where key is provided by the [keySelector] function and value is provided by the [valueTransform] function applied to elements of the given sequence.
If any two elements would have the same key returned by [keySelector] the last one gets added to the map.

Returns a [Map] where keys are elements from the given sequence and values are produced by the [valueSelector] function applied to each element.
If any two elements are equal, the last one gets added to the map.
The returned map preserves the entry iteration order of the original sequence.
The operation is _terminal_.
