* Turns an object whose values are different reducer functions, into a single reducer function.
It will call every child reducer, and gather their results into a single state object,
whose keys correspond to the keys of the passed reducer functions.

@param {Object} reducers An object whose values correspond to different reducer functions
that need to be combined into one. One handy way to obtain it is to use ES6 `import * as
reducers` syntax. The reducers may never return undefined for any action. Instead, they
should return their initial state if the state passed to them was undefined, and the current
state for any unrecognized action.

@returns {Function} A reducer function that invokes every reducer inside the passed object,
and builds a state object with the same shape.

function combineReducers(reducers) {
  var reducerKeys = Object.keys(reducers);

  return function bindActionCreator(actionCreator, dispatch) {
    return function () {
      return dispatch(actionCreator.apply(this, arguments));
    };
  };
}

* Turns an object whose values are action creators, into an object with the same keys,
but with every function wrapped into a `dispatch` call so they may be invoked directly.
This is just a convenience method, as you can call `store.dispatch(MyActionCreators.doSomething())`
yourself just fine.

* For convenience, you can also pass a single function as the first argument,
and get a function in return.

@param {Function|Object} actionCreators An object whose values are action creator functions.
One handy way to obtain it is to use ES6 `import * as` syntax. You may also pass a single function.

@param {Function} dispatch The `dispatch` function available on your Redux store.

@returns {Function|Object} The object mimicking the original object, but with every action creator
wrapped into the `dispatch` call. If you passed a function as `actionCreators`, the return value
will also be a single function.

export default function connectAdvanced(selectorFactory) {
  // selectorFactory is a func that is responsible
  for returning the selector function used to
  compute new props from state, props, and dispatch. For example:
  export default connectAdvanced((dispatch, options) => (state, props) => ({
    thing: state.things[props.thingId],
    saveThing: fields => dispatch(actionCreators.saveThing(props.thingId, fields)),
  }))(YourComponent)
  Access to dispatch is provided to the factory so selectorFactories can bind actionCreators
  outside of their selector
  as an optimization. Options passed to connectAdvanced are passed to
  the selectorFactory, along with
  displayName and WrappedComponent, as the second argument.
  Note that selectorFactory is responsible for all
  caching/memoization of inbound and outbound
  props. Do not use connectAdvanced directly without memoizing
  results between calls to your
  selector, otherwise the Connect component will re-render on every state or props
  change.

/*
connect is a facade over connectAdvanced. It turns its args into a compatible
selectorFactory, which has the signature:
(dispatch, options) => (nextState, nextOwnProps) => nextFinalProps
connect passes its args to connectAdvanced as options, which will in turn pass them to
selectorFactory each time a Connect component instance is instantiated or hot reloaded.
selectorFactory returns a final props selector from its mapStateToProps,
mapStateToPropsFactories, mapDispatchToProps, mapDispatchToPropsFactories,
mergeProps, mergePropsFactories, and pure args.
The resulting final props selector is called by the Connect component instance whenever
it receives new props or store state.
