- vrf (IP SLA), on page 65

## access-list

To define the access list, use the **access-list** command in policy configuration mode. To remove the access list, use the **no** form of this command.

```

access-list access-list-name [ sequence sequence-value [ match [ destination-ip dest-ip/length | source-ip
src-ip/length | destination-port dest-port-range | source-port src-port-range | destination-data-prefix-list
prefix | source-data-prefix-list prefix | destination-tag-instance dest-tag-name | source-tag-instance
src-tag-name ] action { accept | [ class | count ] | drop | count } | action ] | default-access | drop accept
]
no access-list

```

### Syntax Description

<b>destination-data-prefix-list</b>	(Optional) Specifies the destination prefix list.
-------------------------------------	---

<b>destination-ip</b>	(Optional) Specifies the list of destination addresses.
<b>destination-port</b>	(Optional) Specifies the list of destination ports.
<b>count</b>	(Optional) Specifies the number of packets/bytes matching this rule drop.
<b>destination-tag-instance</b>	(Optional) Specifies the name of the destination tag instance. Valid range is from 1 to 127 characters.
<b>source-data-prefix-list</b>	(Optional) Specifies the source data prefix list.
<b>source-ip</b>	(Optional) Specifies the list of source IP addresses.
<b>source-port</b>	(Optional) Specifies the list of source ports.
<b>source-tag-instance</b>	(Optional) Specifies the name of the source tag instance. Valid range is from 1 to 127 characters.

**Command Default**

The access list defaults to an implicit deny statement for everything. An implicit deny statement terminates an access list.

**Command Modes**

Policy configuration (config-policy)

**Command History**

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.
Cisco IOS XE Catalyst SD-WAN Release 17.9.1a	This command was modified. Policy match configuration is enhanced to include <b>source-tag-instance</b> and <b>destination-tag-instance</b> keyword parameters in ACL-matching attributes.

**Usage Guidelines**

After ACL is defined, it can be applied to an interface.

**Examples**

The following is a sample output of this command:

```
access-list acl1
  sequence 10
  match
    destination-ip 172.16.5.10
  !
  action drop
  default-action accept
  action drop
  count 192-167-199-DROP-CNT
access-list 4451-Marking-Spoke
  sequence 1
  match
    destination-ip 172.16.10.5
  !
  action accept
  count SSL
  class LLQ
```

```
count EXCHANGE
class CONTROL-SIGNALING
```

The following example shows how to configure **source-tag-instance** in a localized policy:

```
policy
lists
  data-prefix-list pfx1
  ip-prefix 10.20.24.0/24
  !
  !
access-list acl
sequence 10
match
  source-tag-instance red
  !
action accept
  count acl_input_wc
  !
  !
default-action drop
!
!
```

## action (centralized policy)

To define the action to take when the match portion in a match–action pair is met, use the **action** command in sequence configuration mode. To remove configured sub-actions or reset the action to the default of drop, use the **no** form of this command.

```
action { drop { count counter-name | log } | accept { count counter-name | nat use-vpn 0 | log
| local-tloc | policer policer-name | next-hop ipv4-address next-hop-loose | set { vpn vpn-number
} | { set tloc ip-address color color } } }
```

```
no action { drop { count counter-name | log } | accept { count counter-name | nat use-vpn 0
| log | local-tloc | policer policer-name | next-hop ipv4-address next-hop-loose | set { vpn vpn-number
} | { set tloc ip-address color color } } }
```

Syntax Description		Description
<b>drop</b>		Defines the action to drop matching packets.
<b>accept</b>		Defines the action to accept matching packets and to perform any specified actions.
<b>nat use-vpn 0</b>		Ensures that matching traffic is sent to VPN 0 after the source IP is translated, based on the policy match criteria.
<b>count</b> <i>counter-name</i>		Counts the packets that match the match criteria, saving the information to the specified filename.
<b>log</b>		Logs the packet headers into system logging (syslog) files.

<b>set tloc</b> <i>ip-address color color</i> [encap <i>encapsulation</i> ]	Sets the TLOC identified IP address and color. Directs matching packets to a TLOC identified by its IP address and color, and optionally, by its encapsulation. <i>color</i> can be <b>3g</b> , <b>biz-internet</b> , <b>blue</b> , <b>bronze</b> , <b>custom1</b> , <b>custom2</b> , <b>custom3</b> , <b>default</b> , <b>gold</b> , <b>green lte</b> , <b>metro-ethernet</b> , <b>mpls</b> , <b>private1</b> through <b>private6</b> , <b>public-internet</b> , <b>red</b> , and <b>silver</b> .  By default, <i>encapsulation</i> is <b>ipsec</b> . It can also be <b>gre</b> .
<b>policer</b> <i>policer-name</i>	Police the packets using the specified policer.
<b>set dscp</b> <i>dscp-value</i>	For QoS, set or overwrite the DSCP value in the packet. Range: 0 through 63.
<b>set local-vpn</b> <i>local-vpn-number</i>	Sets the local VPN number. Range: 0 through 65530.
<b>set next-hop</b> <i>ipv4-address</i>	Sets the next-hop address. The address must be an IPv4 address.
<b>set next-hop-loose</b>	Routes the traffic using an available route if the next-hop address is not available. This parameter is supported only for centralized data policies.

**Command Default** The default behavior is dropped.

**Command Modes** Policy configuration (config-policy)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Command qualified for use in CLI templates.
	Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	This command was modified. Added next-hop-loose keyword to redirect application traffic to an available route when next-hop address is not available.
	Cisco IOS XE Catalyst SD-WAN Release 17.13.1a	This command was modified. Added the <b>nat use vpn0</b> keyword for NAT66 to configure the centralized data policy.

**Usage Guidelines** The sequence numbering feature applies sequence numbers to match-action pairs. The match-action pairs are evaluated in order, by sequence number, starting with the lowest numbered pair and ending when it matches the conditions in one of the pairs.

When a packet matches one of the match conditions, the defined action is taken. Or if no match occurs, the default action is taken.

This command can be used to define the action to take when the match portion in a match-action pair is met.

**Note** The **set next-hop-loose** option can be applied only if **set next-hop** action is defined.

### Example

The following example shows how to create a centralized control policy that changes the TLOC for accepted packets:

```
Device(config)# policy
  control-policy change-tloc
  sequence 10
  action accept
  set tloc 10.1.1.2
```

The following example shows how to create a data policy using next-hop-loose command in order to route the packet using routing entry from routing table if next-hop is not reachable.

```
show policy from-vsmart
from-vsmart data-policy data_pol_nhl
direction all
vpn-list vpn1
sequence 12
match
  source-ip 10.20.24.150/32
action accept
count data_pol_nhl_ctr
set
  next-hop 96.0.1.100
  next-hop-loose
sequence 122
match
  source-ip 10.20.25.150/32
action accept
default-action drop
```

The following example shows how to configure a NAT66 DIA route using a centralized data policy so that data traffic is NATed before entering the overlay tunnel that is located in the transport VPN:

```
Device(config)# policy
data-policy policy-name
vpn-list vpn_list
sequence number
match
  source-ipv6 ipv6-address
!
action accept
nat use-vpn 0
nat fallback
set
  local-tloc-color lte
```

For more information about, see the section *NAT66 DIA With Centralized Data Policy* in [Information About NAT DIA](#)

## action (localized policy)

To define the action to take when the match portion in a match–action pair is met, use the **action** command in access control list sequence configuration mode. To remove configured sub-actions or reset the action to the default of drop, use the **no** form of this command.

```

action { drop { count counter-name | log } | accept { class class-name | count counter-name |
log | mirror mirror-name | policer policer-name } | set { dscp dscp-value | local-vpn
local-vpn-number | next-hop ipv4-address next-hop-loose } }
no action { drop { count counter-name | log } | accept { class class-name | count counter-name
| log | mirror mirror-name | policer policer-name } | set { dscp dscp-value | local-vpn
local-vpn-number | next-hop ipv4-address } }

```

Syntax Description		
<b>drop</b>		Defines the action to drop matching packets.
<b>accept</b>		Defines the action to accept matching packets and to perform any specified actions.
<b>count</b> <i>counter-name</i>		Counts the packets that match the match criteria, saving the information to the specified filename.
<b>log</b>		Logs the packet headers into system logging (syslog) files.
<b>class</b> <i>class-name</i>		Assigns the packets to the specified QoS class name.
<b>mirror</b> <i>mirror-name</i>		Mirrors the packets to the specified mirror.
<b>policer</b> <i>policer-name</i>		Police the packets using the specified policer.
<b>set dscp</b> <i>dscp-value</i>		For QoS, set or overwrite the DSCP value in the packet. Range: 0 through 63.
<b>set local-vpn</b> <i>local-vpn-number</i>		Sets the local VPN number. Range: 0 through 65530.

**Command Default** The default behavior is dropped.

**Command Modes** Access control list sequence configuration (config-sequence-*{sequence-number}*)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines** Access control lists (ACLs) perform packet filtering to control which packets move through an interface of a router. The packet filtering provides security by helping to limit the network traffic, restrict the access of users and devices to a network, and prevent the traffic from leaving a network interface. An access control list is a sequential list consisting of match-action pairs.

The sequence numbering feature applies sequence numbers to match-action pairs. The match–action pairs are evaluated in order, by sequence number, starting with the lowest numbered pair and ending when it matches the conditions in one of the pairs.

When a packet matches one of the match conditions, the defined action is taken. Or if no match occurs, the default action is taken.

This command can be used to define the action to take when the match portion in a match–action pair is met.

### Example

The following example creates an access control list named ACL-TEST-1, defines sequence #10, enters the match configuration mode, specifies destination IP 10.10.10.10/32 as a match parameter, and defines the action to drop and logs the packet when matched.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 10
Device(config-sequence-10)# match
Device(config-match)# destination-ip 10.10.10.10/32
Device(config-match)# exit
Device(config-sequence-10)# action drop
Device(config-action)# log
```

The following example creates an access control list named ACL-TEST-1, defines sequence #20, enters the match configuration mode, specifies packet length of 10 as a match parameter and defines the action to accept and applies the policer policy POL1 when matched.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 20
Device(config-sequence-20)# match
Device(config-match)# packet-length 10
Device(config-match)# exit
Device(config-sequence-20)# action accept
Device(config-action)# policer POL1
```

**Table 1: Related Commands**

Commands	Description
<b>match</b>	Enters the match configuration mode or to define match parameters.

## app-agg-node

To set the maximum rate of Flexible NetFlow (FNF) records of aggregated traffic data that a device sends to Cisco SD-WAN Manager, use the **app-agg-node** command in policy configuration mode on a device. To restore the default limit, use the **no** form of the command.

**app-agg-node** *max-records-per-minute*

**no app-agg-node**

### Syntax Description

*max-records-per-minute* Maximum number of FNF records per minute of aggregated traffic data for a device to send to Cisco SD-WAN Manager.

Range: 16 to 10000 FNF records per minute

Default: 10000 FNF records per minute

### Command Modes

Policy configuration (config-policy)

**Command Default** 10000 FNF records per minute

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.14.1a	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines**

When traffic flow visibility is enabled (see [Configure Global Flow Visibility](#)), devices in the network send raw and aggregated traffic flow data to Cisco SD-WAN Manager.

To aggregate flow data, routers use 4-tuples of flow data (containing VPN ID, application name, ingress interface of the flow, and egress interface of the flow) as a key for consolidating the raw data of multiple flows. The router consolidates each flow for which the 4-tuple is identical into a single aggregated FNF record.

Cisco SD-WAN Manager uses the aggregated data to provide a high-level view of network traffic flow information. The aggregated data shows the network applications that are producing traffic, but is less granular than the full traffic flow data. It does not provide source and destination addresses, or source and destination ports for traffic flows.

You can configure a maximum rate of aggregated traffic data FNF records that a device can send to reduce the performance demands (CPU and memory) on the device. This may be helpful when there is a large number of applications producing network traffic.

### Example 1

The following configures a device to send a maximum of 1000 FNF records per minute.

```
Device(config)# policy
Device(config-policy)# app-agg-node 1000
```

### Example 2

The following restores a device to the default value of sending a maximum of 10000 FNF records per minute.

```
Device(config)# policy
Device(config-policy)# no app-agg-node
```

## apply-policy

To have a policy take effect by applying it to sites within the overlay network (on Cisco vSmart Controllers only), use the **apply-policy** command in the policy lists configuration mode. To remove the listing of sites, use the **no apply-policy** form of this command.

**apply-policy**

**no apply-policy**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** policy lists configuration (config-lists)

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

```
vSmart(config)# apply-policy
vSmart(config-apply-policy)# site-list cedge_1
vSmart(config-site-list-ledge_1)# data-policy sig_ha_zscaler_data_policy_ledge from-service
```

```
vSmart(config)# apply-policy
vSmart(config-apply-policy)# site-list cedge_1
vSmart(config-site-list-ledge_1)# data-policy sig_ha_zscaler_data_policy_ledge from-tunnel
```

```
vSmart(config)# apply-policy
vSmart(config-apply-policy)# site-list cedge_1
vSmart(config-site-list-ledge_1)# data-policy sig_ha_zscaler_data_policy_ledge all
```

## app-probe-class

To define a forwarding class and DSCP marking per color that a particular class of applications is forwarded to, use the **app-probe-class** command in global configuration mode.

**app-probe-class** *app-probe-class-name*

**no app-probe-class** *app-probe-class-name*

Syntax Description	
<b>app-probe-class</b>	Specifies the app-probe-class of SLA class applications that is forwarded to devices.
<i>app-probe-class-name</i>	Specifies the app-probe-class name.

**Command Default** There are no default values.

**Command Modes** Global configuration (config)

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

In the following example, you can create real-time-video app-probe-class with DSCP measurements:

```
vSmart(config)# app-probe-class real-time-video
vSmart(config)# forwarding-class videofc
vSmart(config)# color mpls dscp 34
vSmart(config)# color biz-internet dscp 40
```

```
vSmart(config)# color lte dscp 0
```

## app-route-policy

To configure application route policy for the Cisco IOS XE Catalyst SD-WAN devices, use the **app-route-policy** command in the policy configuration mode.

**app-route-policy** *policy-name*

<b>Syntax Description</b>	<b>app-route-policy</b> <i>policy-name</i>	Name of the application-aware routing policy to configure or to apply to a list of sites in the overlay network. <i>policy-name</i> can be up to 32 characters long.
<b>Command Modes</b>	Policy configuration (config-policy)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a Command qualified for use in CLI templates.	
<b>Usage Guidelines</b>	For more information about this command, see Policies Configuration guide.	

The following example shows how to configure and apply a data policy for application-aware routing:

```
vSmart# show running-config policy
policy
 sla-class test_sla_class
   latency 50
 !
app-route-policy test_app_route_policy
 vpn-list vpn_1_list
  sequence 1
   match
    protocol 6
   !
   action sla-class test_sla_class strict
  !
  sequence 2
   match
    protocol 17
   !
   action sla-class test_sla_class
  !
  sequence 3
   match
    protocol 1
   !
   action sla-class test_sla_class strict
  !
 !
 !
lists
 vpn-list vpn_1_list
  vpn 1
 !
```

```

site-list site_500
  site-id 500
!
site-list site_600
  site-id 600
!
!
!
!
apply-policy
  site-list site_500
  app-route-policy test_app_route_policy
!
!

```

The following example shows how to configure a policy for application-aware routing:

```

policy
  app-route-policy policy-name
  vpn-list list-name
  default-action sla-class sla-class-name
  sequence number
  match
    app-list list-name
    destination-data-prefix-list list-name
    destination-ip prefix/length
    destination-port number
    dns (request | response)
    dns-app-list list-name
    dscp number
    plp (high | low)
    protocol number
    source-data-prefix-list list-name
    source-ip prefix/length
    source-port address
  action
    backup-sla-preferred-color colors
    count counter-name
    log
    sla-class sla-class-name [strict] [preferred-color colors]

```

## app-visibility

To enable application visibility so that a router can monitor and track the applications running on the LAN use the **app-visibility** command. Use the **no** form of this command to disable application visibility.

### app-visibility

#### Command Default

Disabled.

#### Command Modes

Policy configuration (config-policy)

#### Command History

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** To enable NBAR feature to recognize applications. Use the **show sdwan app-fwd dpi** command to see DPI flows.

**Examples** Enable application-visibility on a router:

```
Router(config)# policy
Router(config-policy)# app-visibility
```

## app-visibility-ipv6

To enable application visibility IPv6, so that a router can monitor and track the applications running on the LAN use the **app-visibility-ipv6** command. Use the **no** form of this command to disable application visibility IPv6.

### app-visibility-ipv6

**Command Default** Disabled.

**Command Modes** Policy configuration (config-policy)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** To enable NBAR feature to recognize applications. Use the **show sdwan app-fwd dpi** command to see DPI flows.

**Examples** Enable application-visibility on a router:

```
Router(config)# policy
Router(config-policy)# app-visibility-ipv6
```

## burst

To define the burst size for a policer profile, use the **burst** command in policer configuration mode.

**burst** *burst-size*

**Note** Burst is a required parameter in a policer profile. Entering **no burst** *burst-size* is valid, but causes **commit** to fail.

**Syntax Description** *burst-size* Maximum traffic burst size, in bytes. The range is from 15000 to 10000000.

**Command Default** None

**Command Modes** Policer configuration (config-policer-*{profile-name}*)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines** To configure policing parameters, create a policer that specifies the maximum bandwidth and burst rate for traffic on an interface, and how to handle traffic that exceeds these values.

This command can be used to define the burst size for a policer profile.

### Example

The following example defines a policer profile named `pol1`. It sets the rate to 500,000,000 bps, and burst size to 15,000 bytes, and configures to drop the traffic if the burst size or traffic rate is exceeded.

```
Device(config)# policy
Device(config-policy)# policer pol1
Device(config-policy-pol1)# rate 500000000
Device(config-policy-pol1)# burst 15000
Device(config-policy-pol1)# exceed drop
```

The following example applies a policer using an Access List named `ACL-TEST-1`.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 1
Device(config-sequence-1)# action drop
Device(config-action)# policer pol1
```

**Note** Rate, burst, and exceed must be defined before committing, otherwise the commit is aborted.

**Table 2: Related Commands**

Commands	Description
<b>exceed</b>	Action to take when the burst size or traffic rate is exceeded.
<b>rate</b>	Bandwidth for 1G interfaces, the range is from 8 to 1000000000 bps; for 10G interfaces, the range is from 8 to 10000000000 bps.

## class (class-map)

To specify the name of the class whose policy you want to create or change before you configure its policy, use the **class** command in class-map configuration mode. To remove a class from the class map, use the **no** form of this command.

```
class class-name
no class { class-name }
```

Syntax Description	
<i>class-name</i>	Name of the class to be configured or whose policy is to be modified. The class name is used for both the class map and to configure a policy for the class in the policy map.

**Command Default** No class is specified.

**Command Modes** Class-map configuration (config-class-map)

Command History	Release	Modification
	Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** For usage guidelines, see the Cisco IOS XE, [class](#) command.

**Examples** The following is an example of this command:

```
Device(config)# policy
Device(config-policy)# class-map
Device(config-class-map)# class VOICE queue 0
```

## COS

To set the class of service (CoS) for a Cisco IOS IP Service Level Agreements (SLAs) Ethernet operation, use the **cos** command in the appropriate submode of IP SLA configuration or IP SLA Ethernet monitor configuration mode. To return to the default value, use the **no** form of this command.

<i>cos-value</i>	Class of service (CoS) value. The range is from 0 to 7. The default is 0.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines** For more information about this command, see the Cisco IOS XE [cos](#) command.

**Examples**

The following example shows how to configure this command:

```
Interface interface-name
 cfm mep domain domain-name mpid id service service-name
  alarm notification all*
  cos 0-7
```

# count

To specify the number of packets that matches the match criteria, use the **count** command in the action configuration mode. To remove the count that matches the match criteria, use the **no** form of this command.

**count** { *counter-name* }

**no count** { *counter-name* }

**Syntax Description**

*counter-name* Specifies the count of the packets that match the match criteria, and saving the information to a specified filename.

**Command Default**

None

**Command Modes**

action configuration (config-action)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see [Centralized Policy](#).

The following example creates an access control list named ACL-TEST-1, defines sequence #10, enters the match configuration mode, specifies destination IP 10.10.10.10/32 as a match parameter, defines the action to accept, and specifies the packets that match the match criteria in the seqcnt\_100 file.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 10
Device(config-sequence-10)# match
Device(config-match)# destination-ip 10.0.0.0/8
Device(config-match)# exit
Device(config-sequence-10)# action accept
Device(config-action)# count seqcnt_100
```

## data-policy

To configure or apply a centralized data policy based on data packet header fields (on Cisco vSmart controllers only), use the **data-policy** command in policy configuration mode. To remove the configured centralized data policy for deep packet inspection, use the **no** form of this command.

**data-policy** { *policy-name* }

**no data-policy** { *policy-name* }

<b>Syntax Description</b>	<i>policy-name</i> Specifies the name of the centralized data policy to configure or to apply to a list of sites in the overlay network.  The maximum characters allowed are 32.
---------------------------	--

**Command Default** None

**Command Modes** Policy configuration (config-policy)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** For more information about this command, see configuring the deep packet inspection in the [Policies Configuration Guide](#).

```
vSmart(config)# policy
vSmart(config-policy)# data-policy sig_ha_zscaler_data_policy_cedge
```

## default-action

To configure the default action to be taken when the match condition in an access list isn't met for the Cisco IOS XE Catalyst SD-WAN devices, use the **default-action** command in the policy access list configuration mode. To remove the default configuration, use the **no default-action** form of this command.

**default-action** [**drop**] { **accept** | **drop** }

**no default-action**

<b>Syntax Description</b>	<b>accept drop</b> Specifies the default action to take if a route being evaluated by a policy matches none of the match conditions. If you configure a policy and define an access list with one or more match-action sequences, the default action, is to either accept or drop the item, depending on the policy type.
---------------------------	---

**Command Default** None

**Command Modes** policy access list configuration (config-access-list)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see [Localized Policy](#).

The following example shows that if a packet being evaluated doesn't match any of the match conditions in an access list, a default action is applied to this packet. By default, the packet is dropped.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 10
Device(config-sequence-10)# match
Device(config-match)# destination-ip 10.10.10.10/32
Device(config-match)# exit
Device(config-match)# exit
Device(config-access-list-ACL-TEST-1)# default-action accept
```

## destination-ip

To list the destination addresses for an access control list, use the **destination-ip** command in the match configuration mode. To remove the list of destination addresses, use the **no** form of this command.

**destination-ip** { *ipv4-prefix/prefix-length* }

**no destination-ip** { *ipv4-prefix/prefix-length* }

**Syntax Description**

*ipv4-prefix/prefix-length* Specifies IPv4 prefix in dotted decimal and the length of the IPv4 prefix.

Specifies the prefix-length, which is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.

**Command Default**

None

**Command Modes**

match configuration (config-match)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see [Centralized Policy](#).

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 10
Device(config-sequence-10)# match
```

```
Device(config-match)# destination-ip 10.10.10.10/32
Device(config-match)# exit
```

## exceed

To define the exceed action for a policer profile, use the **exceed** command in policer configuration mode.

```
exceed { drop | remark }
```

<b>Syntax Description</b>	<i>drop</i> Drops excess traffic when the burst size or traffic rate is exceeded. The drop action is equivalent to setting the packet loss priority (PLP) to low.				
	<i>remark</i> Remarks the traffic. The remark action sets the PLP to high.				
<b>Command Default</b>	None				
<b>Command Modes</b>	Policer configuration (config-policer-{profile-name})				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Catalyst SD-WAN Release 17.2.1v</td> <td>Command qualified for use in Cisco SD-WAN Manager CLI templates.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.
Release	Modification				
Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.				

**Usage Guidelines** To configure policing parameters, create a policer that specifies the maximum bandwidth and burst rate for traffic on an interface, and how to handle traffic that exceeds these values.

This command can be used to define the action to take if the burst size or traffic rate is exceeded.

### Example

The following example defines a policer profile named poll. It sets the rate to 500,000,000 bps, and burst size to 15,000 bytes, and configures to drop the traffic if the burst size or traffic rate is exceeded.

```
Device(config)# policy
Device(config-policy)# policer poll
Device(config-policy-poll)# rate 500000000
Device(config-policy-poll)# burst 15000
Device(config-policy-poll)# exceed drop
```

The following example applies a policer using an Access List named ACL-TEST-1.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 1
Device(config-sequence-1)# action drop
Device(config-action)# policer poll
```

**Note** Rate, burst, and exceed must be defined before committing, otherwise the commit is aborted.

Table 3: Related Commands

Commands	Description
<b>burst</b>	Maximum traffic burst size, in bytes. The range is from 15000 to 10000000.
<b>rate</b>	Bandwidth for 1G interfaces, the range is from 8 to 1000000000 bps; for 10G interfaces, the range is from 8 to 10000000000 bps.

## flow-visibility

To enable flow visibility so that a router can perform traffic flow monitoring on traffic coming to the router from the LAN use the **flow-visibility** command. To disable the flow visibility use the **no** form of this command.

**flow-visibility**

**no flow-visibility**

### Command Default

Disabled.

### Command Modes

Policy configuration (config-policy)

### Command History

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

### Usage Guidelines

Use the **show sdwan app-fwd cflowd** command to enable cflowd flow monitoring.

### Examples

The following is an example of this command

```
Router(config)# policy
Router(config-policy)# flow-visibility
```

## flow-visibility-ipv6

To enable flow visibility IPv6, so that a router can perform traffic flow monitoring on traffic coming to the router from the LAN use the **flow-visibility-ipv6** command. To disable the flow visibility use the **no** form of this command.

**flow-visibility-ipv6**

**no flow-visibility-ipv6**

**Command Default** Disabled.

**Command Modes** Policy configuration (config-policy)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** Use the **show sdwan app-fwd cflowd** command to enable cflowd flow monitoring.

**Examples** The following is an example of this command

```
Router(config)# policy
Router(config-policy)# flow-visibility-ipv6
```

## icmp-echo

To configure an IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) echo operation, use the **icmp-echo** command in IP SLA configuration mode.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** For usage guidelines, see the Cisco IOS XE [icmp-echo](#) command

**Examples** In the following example, IP SLAs operation 10 is created and configured as an echo operation using the ICMP protocol and the destination IPv4 address 10.16.1.175:

```
Device# config-transaction
Device(config)# ip sla 10
Device(config-ip-sla)# icmp-echo 10.16.1.175
Device(config-ip-sla-echo)#
```

In the following example, IP SLAs operation 11 is created and configured as an echo operation using the ICMP protocol and the destination IPv6 address 2001:DB8:100::1:

```
Device# config-transaction
Device(config)# ip sla 11
Device(config-ip-sla)# icmp-echo 2001:DB8:100::1
Device(config-ip-sla-echo)#
```

# implicit-acl-on-bind-intf

To enable implicit ACL protection on a physical interface (bound to a loopback interface), use the **implicit-acl-on-bind-intf** command in the global configuration mode. To remove this change, use the no form of this command.

## Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.9.1a	Command qualified for use in Cisco vManage CLI templates.

## Examples

The following example shows how to enable a physical interface as a TLOC.

```
Device(config)# sdwan interface Loopback1
Device(config-interface-Loopback1)# tunnel-interface
Device(config-tunnel-interface)# encap ipsec
Device(config-tunnel-interface)# color 3g
Device(config-tunnel-interface)# bind GigabitEthernet1
Device(config-tunnel-interface)#implicit-acl-on-bind-intf
```

# inspect

To enable Cisco IOS stateful packet inspection, use the **inspect** command in policy-map-class configuration mode. To disable stateful packet inspection, use the **no** form of this command.

```
inspect
no inspect
```

## Command Default

Cisco IOS stateful packet inspection is disabled.

## Command Modes

Policy-map-class configuration (config-pmap-c)

## Command History

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

## Usage Guidelines

For usage guidelines, see the Cisco IOS XE [inspect](#) command.

## Examples

The following example specifies inspection parameters and requests the **inspect** action with the specified inspect parameter:

```
policy-map type inspect mypolicy
class type inspect inspect-traffic
inspect
```

# ip-prefix

To define an IP prefix for a data-prefix-list or prefix-list, use the **ip-prefix** command in data-prefix-list or prefix-list configuration mode. To remove an IP prefix for a data-prefix-list or prefix-list, use the **no** form of this command.

```
ip-prefix IP/length [ ge length ][ le length ]
no ip-prefix IP/length
```

Syntax Description	
<i>IP/length</i>	IP address and CIDR.
<b>ge</b>	(Optional) (Prefix-list only, not available for data-prefix-list) Specifies the minimum prefix length to be matched.
<b>le</b>	(Optional) (Prefix-list only, not available for data-prefix-list) Specifies the maximum prefix length to be matched.
<i>length</i>	Specifies the prefix length, ranges from 1 to 32.

**Command Default** None

**Command Modes** data-prefix-list configuration (config-data-prefix-list-*{data-prefix-list list-name}*)  
prefix-list configuration (config-prefix-list-*{prefix-list list-name}*)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines** Lists are used to create groupings of similar objects, such as IP prefixes, sites, TLOC addresses, and AS paths, for use when configuring policy match conditions or action operations and for when applying a policy.

Data-prefix-list is a list of prefixes used in data-policy to define prefix and upper layer ports, either individually or jointly, for traffic matching.

Prefix-list is a list of prefixes used in route-maps. This command can be used to define the ip prefix for a data-prefix-list or prefix-list.

## Example

The following example defines a data prefix list named Email-Server. The IP prefix of 10.10.10.10/32 is added to the data prefix list Email-Server.

```
Device(config)# policy
Device(config-policy)# lists
Device(config-lists)# data-prefix-list Email-Server
Device(config-data-prefix-list-Email-Server)# ip-prefix 10.10.10.10/32
```

The following example defines a prefix list named Web-Server. The IP prefix of 10.10.0.0/16 is added to the data prefix list Web-Server.

```

Device(config)# policy
Device(config-policy)# lists
Device(config-lists)# prefix-list Web-Server
Device(config-prefix-list-Web-Server)# ip-prefix 10.10.0.0/1

```

## ip sla

To begin configuring a Cisco IOS IP Service Level Agreements (SLAs) operation and enter IP SLA configuration mode, use the **ip sla** command in global configuration mode. To remove all configuration information for an operation, including the schedule of the operation, reaction configuration, and reaction triggers, use the **no** form of this command.

### Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

### Usage Guidelines

For usage guidelines, see the Cisco IOS XE [ip sla](#) command.

### Examples

The following example shows how to configure a Cisco IOS IP SLA operation.

```

Device# config-transaction
Device(config)# ip sla 1
Device(config-ip-sla)#

```

## ip sla reaction-configuration

To configure proactive threshold monitoring parameters for an IP Service Level Agreements (SLAs) operation, use the **ip sla reaction-configuration** command in global configuration mode. To disable all the threshold monitoring configuration for a specified IP SLAs operation, use the **no** form of this command.

### Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation for which reactions are to be configured.
-------------------------	---

<p><b>react</b> <i>monitored-element</i> (continued)</p>	<ul style="list-style-type: none"> <li>• <b>packetLoss</b> —Specifies that a reaction should occur if the packet loss value violates the upper threshold or lower threshold. The path of the packets is unknown.</li> <li>• <b>packetLossDS</b> —Specifies that a reaction should occur if the one-way destination-to-source packet loss value violates the upper threshold or lower threshold.</li> <li>• <b>packetLossSD</b> —Specifies that a reaction should occur if the one-way source-to-destination packet loss value violates the upper threshold or lower threshold.</li> <li>• <b>rtt</b> —Specifies that a reaction should occur if the round-trip time violates the upper threshold or lower threshold.</li> <li>• <b>timeout</b> —Specifies that a reaction should occur if there is a one-way timeout for the monitored operation. The <b>threshold-value</b> keyword does not apply to this monitored element.</li> </ul>
<p><b>action-type</b> <i>option</i></p>	<p>(Optional) Specifies what action or combination of actions the operation performs when threshold events occur. If the <b>threshold-type</b> keywords are defined, the <b>action-type</b> keyword is disabled. The <i>option</i> argument can be one of the following keywords:</p> <ul style="list-style-type: none"> <li>• <b>none</b> —No action is taken. This option is the default value.</li> <li>• <b>trapAndTrigger</b> —Trigger a Simple Network Management Protocol (SNMP) trap and start another IP SLAs operation when the violation conditions are met, as defined in the <b>trapOnly</b> and <b>triggerOnly</b> options.</li> <li>• <b>trapOnly</b> —Send an SNMP logging trap when the specified violation type occurs for the monitored element.</li> <li>• <b>triggerOnly</b> —Transition one or more target operation's operational state from pending to active when the violation conditions are met. The target operations to be triggered are specified using the <b>iplsareaction-trigger</b> command.</li> </ul>
<p><b>threshold-type average</b> [<i>number-of-measurements</i>]</p>	<p>(Optional) When the average of a specified number of measurements for the monitored element exceeds the upper threshold or when the average of a specified number of measurements for the monitored element drops below the lower threshold, perform the action defined by the <b>action-type</b> keyword. For example, if the upper threshold for <b>reactrttthreshold-typeaverage3</b> is configured as 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be <math>6000 + 6000 + 5000 = 17000/3 = 5667</math>, thus violating the 5000 ms upper threshold.</p> <p>The default number of 5 averaged measurements can be changed using the <i>number-of-measurements</i> argument. The valid range is from 1 to 16.</p> <p>This syntax is not available if the <b>connectionLoss</b>, <b>timeout</b>, or <b>verifyError</b> keyword is specified as the monitored element, because upper and lower thresholds do not apply to these options.</p>

<b>threshold-type</b> <b>immediate</b>	(Optional) When a threshold violation for the monitored element is met, immediately perform the action defined by the <b>action-type</b> keyword.
<b>threshold-value</b> <i>upper-threshold</i> <i>lower-threshold</i>	(Optional) Specifies the upper-threshold and lower-threshold values of the applicable monitored elements. See the Default Threshold Values for Monitored Elements table in the “Usage Guidelines” section for a list of the default values.  <b>Note</b> For MOS threshold values ( <b>reactmos</b> ), the number is expressed in three digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 3.20, enter <b>320</b> . The valid range is from 100 (1.00) to 500 (5.00).

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see the Cisco IOS XE [ip sla reaction-configuration](#) command.

**Examples**

```
ip sla 7001
 icmp-echo 172.31.17.222 source-ip 172.31.17.216
  request-data-size 64
  tag 7001:AVAILABILITY DSO-D7S
  frequency 30
ip sla schedule 7001 life forever start-time now
ip sla reaction-configuration 6001 react rtt threshold-value 40 40 threshold-type immediate
  action-type trapAndTrigger
ip sla reaction-configuration 6001 react timeout threshold-type immediate action-type
  trapAndTrigger
ip sla reaction-configuration 6001 react packetLossDS threshold-value 1 1 threshold-type
  immediate action-type trapAndTrigger
ip sla reaction-configuration 6001 react packetLossSD threshold-value 1 1 threshold-type
  immediate action-type trapAndTrigger
ip sla reaction-configuration 7001 react timeout threshold-type immediate action-type
  trapAndTrigger
```

## ip sla responder

To enable the Cisco IOS IP Service Level Agreements (SLAs) Responder for general IP SLAs operations, use the **ip sla responder** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

The IP SLAs Responder is disabled.

**Command Modes**

Global configuration

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Command qualified for use in Cisco vManage CLI templates.

### Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable the sending and receiving of IP SLAs control packets. Enabling the IP SLAs Responder allows the generation of packet loss statistics on the device sending IP SLAs operations.

Prior to sending an operation packet to the IP SLAs Responder, the IP SLAs operation sends a control message to the IP SLAs Responder to enable the destination port.

For more information about this command, see the Cisco IOS XE [ip sla responder](#) command.

### Examples

The following example shows how to enable the IP SLAs Responder:

```
ip sla responder
```

## ip sla schedule

To configure the scheduling parameters for a single Cisco IOS IP Service Level Agreements (SLAs) operation, use the **ip sla schedule** command in global configuration mode. To stop the operation and place it in the default state (pending), use the **no** form of this command.

### Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to schedule.
<b>life forever</b>	(Optional) Schedules the operation to run indefinitely.
<b>life</b> <i>seconds</i>	(Optional) Number of seconds the operation actively collects information. The default is 3600 seconds (one hour).
<b>start-time</b>	(Optional) Time when the operation starts.
<i>hh : mm [: ss]</i>	Specifies an absolute start time using hour, minute, and (optionally) second. Use the 24-hour clock notation. For example, <b>start-time 01:02</b> means “start at 1:02 a.m.,” and <b>start-time 13:01:30</b> means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a <i>month</i> and <i>day</i> .
<i>month</i>	(Optional) Name of the month to start the operation in. If month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) to start the operation on. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.
<b>pending</b>	(Optional) No information is collected. This is the default value.
<b>now</b>	(Optional) Indicates that the operation should start immediately.

<b>after</b> <i>hh : mm : ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.
<b>random</b> <i>milliseconds</i>	(Optional) Adds a random number of milliseconds (between 0 and the specified value) to the current time, after which the operation will start. The range is from 0 to 10000.

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For usage guidelines, see the Cisco IOS XE [ip sla schedule](#) command.

**Examples**

```
Device(config)#
```

In the following example, operation 1 begins collecting data after a 5-minute delay:

```
Device(config)# ip sla schedule 1 start-time after 00:05:00
```

In the following example, operation 3 begins collecting data immediately and is scheduled to run indefinitely:

```
Device(config)# ip sla schedule 3 start-time now life forever
```

## ip visibility cache entries

To configure the number of entries in IP visibility cache use the **ip visibility cache entries** command. To remove a configured number of entries, use the **no** form of this command.

**ip visibility cache entries****Command Default**

Disabled.

**Command Modes**

Policy configuration (config-policy)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines****Examples**

Enable application-visibility on a router:

```
Router(config)# policy
Router(config-policy)# ip visibility cache entries 20
```

## ipv6 access-list

To define an IPv6 access list and to place the device in IPv6 access list configuration mode, use the **ipv6 access-list** command in global configuration mode. To remove the access list, use the **no** form of this command.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** For usage guidelines, see the Cisco IOS XE [ipv6 access-list](#) command.

### Examples

```
Device# config-transaction
Device(config)# ipv6 access-list test300_v6
Device(config-ip-acl)# sequence 100 permit ipv6 any 2001:DB8::/32
Device(config-ip-acl)#
```

## ipv6 visibility cache entries

To configure the number of entries in IPv6 visibility cache use the **ipv6 visibility cache entries** command. To remove a configured number of entries, use the **no** form of this command.

### ipv6 visibility cache entries

**Command Default** The minimum cache size value is 16. The maximum of total cache size (IPv4 cache + IPv6 cache) should not exceed the limit for each platform. If cache size is not defined and the platform is not in the list, then default maximum cache entries is 200k.

The maximum cache entries is the maximum concurrent flows that Cflowd can monitor. The maximum cache entries vary on different platforms. For more information, contact [Cisco Support](#).

**Command Modes** Policy configuration (config-policy)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

### Usage Guidelines

#### Examples

Enable application-visibility on a router:

```
Router(config)# policy
Router(config-policy)# ipv6 visibility cache entries 100
```

# jitter

To specify the threshold jitter value that Optimized Edge Routing (OER) will permit for an exit link, use the **jitter** command in OER master controller configuration mode. To reset the maximum jitter value to its default value, use the **no** form of this command.

**jitter**  
**no jitter**

**Command Default** No jitter values are specified.

**Command Modes** Policy configuration (config-policy)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates. A app-probe-class keyword is added.

**Usage Guidelines** The **jitter** command is used to specify the maximum tolerable jitter value permitted on an exit link. Jitter is a measure of voice quality where the lower the jitter value, the better the voice quality. If the jitter value is greater than the user-defined or the default value, OER determines that the exit link is out-of-policy and searches for an alternate exit link.

Another measure of voice quality is the estimated Mean Opinion Score (MOS). Use the **mos** command and the **jitter** command in an OER policy to define voice quality.

## Examples

The following example shows how to configure the master controller to search for a new exit link if the jitter threshold value exceeds 20 milliseconds:

```
Router(config)# oer policy
Router(config-policy-map)# jitter threshold 20
```

# lists

To create groupings of similar objects, such as IP prefixes, data-prefixes, and AS paths for use when configuring policy match conditions or action operations, and when to apply a policy, use the **lists** command in the policy configuration mode. To remove the groupings, use the **no lists** form of this command.

**lists** { **app-list** *app-list-name* | **as-path-list** *path-list* | **community-list** *community-name* | **data-ipv6-prefix-list** *data-prefix-list-name* | **data-prefix-list** *prefix-list-name* | **ext-community-list** *ext-community-name* | **ipv6-prefix-list** *ipv6-prefix-list-name* | **prefix-list** *prefix-list-name* }

**no lists** { **app-list** *app-list-name* | **as-path-list** *path-list* | **community-list** *community-name* | **data-ipv6-prefix-list** *data-prefix-list-name* | **data-prefix-list** *prefix-list-name* | **ext-community-list** *ext-community-name* | **ipv6-prefix-list** *ipv6-list-name* | **prefix-list** *list-name* }

**Syntax Description**

<i>app-list-name</i>	(Optional) Lists of one or more applications or application families running on the subnets connected to the Cisco IOS XE Catalyst SD-WAN devices. Each app-list can contain either applications or application families, but not both. To configure multiple applications or application families in a single list, include multiple app or app-family options, by specifying one application or application family in each app or app-family option.
<i>path-list</i>	(Optional) Lists of one or more BGP AS paths. You can write each AS as a single number or as a regular expression. To specify more than one AS in a single path, include the list in quotation marks (" "). To configure multiple AS paths in a single list, include multiple as-path options, and specifying one AS path in each option.
<i>community-name</i>	(Optional) BGP community or communities in the route. list-name is the name of a BGP community list defined with a policy lists community-list command.
<i>data-prefix-list-name</i>	(Optional) List of one or more IPv6 prefixes. You can specify both unicast and multicast prefixes. To configure multiple prefixes in a single list, include multiple <b>ip-prefix</b> options, specifying one prefix in each option.
<i>prefix-list-name</i>	(Optional) List of one or more prefixes. You can specify both unicast and multicast prefixes. To configure multiple prefixes in a single list, include multiple <b>ip-prefix</b> options, specifying one prefix in each option.
<i>ext-community-name</i>	(Optional) BGP extended community or communities in the route. Specifies the name of a BGP extended community list defined with a policy lists <b>ext-community-list</b> command.
<i>ipv6-prefix-list-name</i>	(Optional) List of one or more IPv6 prefixes. To configure multiple prefixes in a single list, include multiple <b>ip-prefix</b> options, specifying one prefix in each option.
<i>prefix-list-name</i>	(Optional) List of one or more IP prefixes. To configure multiple prefixes in a single list, include multiple <b>ip-prefix</b> options, specifying one prefix in each option.

**Command Default**

None

**Command Modes**

policy configuration (config-policy)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see Lists in Localized Policy.

The following example defines a data prefix list named Email-Server. The IP prefix of 10.0.0.0/9 is added to the data prefix list Email-Server.

```
Device(config)# policy
Device(config-policy)# lists
Device(config-lists)# data-prefix-list Email-Server
Device(config-config-data-prefix-list-Email-Server)# ip-prefix 10.0.0.0/9
```

## lists data-prefix-list

To configure a list of one or more IP prefixes, use **lists data-prefix-list** command in policy configuration mode. Use the **no** form of this command to remove the list.

**lists data-prefix-list** *list-name* { **ip-prefix** *prefix/length* }

**no lists**

<b>data-prefix-list</b> <i>list-name</i>	IP Prefix:
<b>ip-prefix</b> <i>prefix/length</i>	List of one or more IP prefixes. You can specify both unicast and multicast prefixes. To configure multiple prefixes in a single list, include multiple <b>ip-prefix</b> options, specifying one prefix in each option.

### Command Default

None.

### Command Modes

Policy configuration (config-policy)

### Command History

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

### Usage Guidelines

#### Configure a list of prefixes:

```
Device# policy
Device(config-policy)# lists
Device(config-policy)# data-prefix-list Email-Server
Device(config-policy)# ip-prefix 10.0.0.0/8
```

## lists

To create groupings of similar objects within a tag-instance, such as IP prefixes, data-prefixes, and app-lists for use when configuring tag-instances, use the **lists** command in tag-instances configuration mode. To remove the groupings, use the **no** form of this command.

**lists** [ **app-list** *app-list-name* ] [ **data-ipv6-prefix-list** *data-prefix-list-name* ] [ **data-prefix-list** *prefix-list-name* ]  
**no lists** [ **app-list** *app-list-name* ] [ **data-ipv6-prefix-list** *data-prefix-list-name* ] [ **data-prefix-list** *prefix-list-name* ]

**Syntax Description**

*app-list-name* (Optional) Lists of one or more applications or application families running on the subnets connected to the . Each app-list can contain either applications or application families, but not both. To configure multiple applications or application families in a single list, include multiple app or app-family options, by specifying one application or application family in each app or app-family option.

*data-prefix-list-name* (Optional) List of one or more IPv6 prefixes. You can specify both unicast and multicast prefixes. To configure multiple prefixes in a single list, include multiple **ip-prefix** options, specifying one prefix in each option.

*prefix-list-name* (Optional) List of one or more prefixes. You can specify both unicast and multicast prefixes. To configure multiple prefixes in a single list, include multiple **ip-prefix** options, specifying one prefix in each option.

**Command Default**

None

**Command Modes**

tag-instances configuration (config-tag-instances)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.9.1a	This command was introduced.

**Usage Guidelines**

Lists configuration under tag-instances are not the same as the lists configured under policy. Tag-instances require their own lists to be configured.

**Examples**

The following example shows how to configure a data prefix list named pfx1. The IP prefix of 10.20.24.0/24 is added to the data prefix list pfx1:

```
vSmart(config)# tag-instances
vSmart(config-tag-instances)# lists
vSmart(config-lists)# data-prefix-list pfx1
vSmart(config-config-data-prefix-list-pfx1)# ip-prefix 10.20.24.0/24
```

# loss

To set the relative or maximum packet loss limit that Optimized Edge Routing (OER) will permit for an exit link, use the **loss** command in OER master controller configuration mode. To return the packet loss limit to the default value, use the **no** form of this command.

**loss****no loss****Command Default**

OER uses the following default value if this command is not configured or if the no form of this command is entered:

**Command Modes**

Policy configuration (config-policy)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

The **loss** command is used to specify the relative percentage or maximum number of packets that OER will permit to be lost during transmission on an exit link. If packet loss is greater than the user-defined or the default value, OER determines that the exit link is out-of-policy and searches for an alternate exit link.

The **relative** keyword is used to configure the relative packet loss percentage. The relative packet loss percentage is based on a comparison of short-term and long-term packet loss. The short-term measurement reflects the percentage of packet loss within a 5-minute period. The long-term measurement reflects the percentage of packet loss within a 60-minute period. The following formula is used to calculate this value:

$$\text{Relative packet loss} = ((\text{short-term loss} - \text{long-term loss}) / \text{long-term loss}) * 100$$

The master controller measures the difference between these two values as a percentage. If the percentage exceeds the user-defined or default value, the exit link is determined to be out-of-policy. For example, if long-term packet loss is 200 PPM and short-term packet loss is 300 PPM, the relative loss percentage is 50 percent.

The **threshold** keyword is used to configure the absolute maximum packet loss. The maximum value is based on the actual number of PPM that have been lost.

**Examples**

The following example configures the master controller to search for a new exit link if the difference between long- and short-term measurements (relative packet loss) is greater than 20 percent:

```
Router(config)# oer master
Router(config-oer-mc)# loss relative 200
```

The following example configures OER to search for a new exit link when 20,000 packets have been lost:

```
Router(config)# oer master
Router(config-oer-mc)# loss threshold 20000
```

## match (access-control-list)

To enter the match configuration in an access list, use the **match** command in access control list sequence configuration mode. To remove match parameters, use the **no** form of this command.

```
match [ destination-data-prefix-list list-name | destination-ip ip/length | destination-port number
| destination-tag-instance dest-tag-name | dscp number | packet-length number | plp { high | low
} | protocol number | source-data-prefix-list list-name | source-ip ip/length | source-port number
| source-tag-instance src-tag-name | tag-instance tag-name | tcp syn ]
no match [ destination-data-prefix-list list-name | destination-ip ip/length | destination-port number
| destination-tag-instance dest-tag-name | dscp number | packet-length number | plp { high | low
} | protocol number | source-data-prefix-list list-name | source-ip ip/length | source-port number
| source-tag-instance src-tag-name | tcp syn ]
```

<b>Syntax Description</b>	<b>destination-data-prefix-list</b> <i>list-name</i>	(Optional) Matches the specified destination prefix list name.
	<b>destination-ip</b> <i>ip/length</i>	(Optional) Matches the specified destination IP.
	<b>destination-port</b> <i>number</i>	(Optional) Matches the specified destination port number. Specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
	<b>dscp</b> <i>number</i>	(Optional) Matches the specified DSCP. The range is from 0 to 63.
	<b>packet-length</b> <i>number</i>	(Optional) Matches the specified packet length. The range is from 0 to 65535. You can enter a range of values.
	<b>plp</b> { <b>high</b>   <b>low</b> }	(Optional) Matches the specified packet's loss priority (PLP).
	<b>protocol</b> <i>number</i>	(Optional) Matches the TCP or IP protocol number. The range is from 0 to 255.
	<b>source-data-prefix-list</b> <i>list-name</i>	(Optional) Matches the specified source prefix list name.
	<b>source-ip</b> <i>IP/length</i>	(Optional) Matches the specified source IP.
	<b>source-port</b> <i>number</i>	(Optional) Matches the specified source port number. Specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
	<b>tcp syn</b>	(Optional) Matches the TCP SYN flag.
	<b>source-tag-instance</b> <i>src-tag-name</i>	(Optional) Matches the specified source tag instance name. The character range is from 1 to 127.
	<b>destination-tag-instance</b> <i>dest-tag-name</i>	(Optional) Matches the specified destination tag instance name. The character range is from 1 to 127.
<b>Command Default</b>	None	
<b>Command Modes</b>	Access control list sequence configuration (config-sequence- <i>{sequence-number}</i> )	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.
	Cisco IOS XE Catalyst SD-WAN Release 17.9.1a	This command was modified. Localized policy match configuration is enhanced to include <b>source-tag-instance</b> , and <b>destination-tag-instance</b> keyword parameters in matching attributes.
<b>Usage Guidelines</b>	Access control lists (ACLs) perform packet filtering to control which packets move through an interface of a router. Packet filtering provides security by helping to limit network traffic, restrict the access of users and	

devices to a network, and prevent the traffic from leaving a network interface. An access control list is a sequential list consisting of match-action pairs.

The Sequence Numbering feature applies sequence numbers to match-action pairs. The match-action pairs are evaluated in an order, by sequence number, starting with the lowest numbered pair and ending when it matches the conditions in one of the pairs.

When a packet matches one of the match conditions, the defined action is taken. Or, if no match occurs, the default action is taken.

The **match** command can be used to enter the match configuration mode or to define match parameters.

## Examples

The following example shows how to create or enter an access control list named ACL-TEST-1, define sequence #10, specify the destination IP address 10.10.10.10/32 as a match parameter, and define the action to drop when matched:

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 10
Device(config-sequence-10)# match destination-ip 10.10.10.10/32
Device(config-match)# exit
Device(config-sequence-10)# action drop
```

The following example shows how to configure a localized access control policy to include tags in the matching attributes:

```
Device(config)# policy
Device(config-policy)# access-list acl1
Device(config-access-list-acl1)# sequence 100
Device(config-sequence-100)# match
Device(config-match)# tag-instance orange
Device(config-match)# source-tag-instance red
Device(config-match)# action accept
Device(config-action)# count acl_input_wc
```

The following example shows how to remove destination IP address 10.10.10.10/32 as a match parameter from the access control list ACL-TEST-1, and sequence #10:

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 10
Device(config-sequence-10)# no match destination-ip 10.10.10.10/32
```

**Table 4: Related Commands**

Commands	Description
<b>action</b>	Specifies action for matched parameters.
<b>access-list</b>	Configures localized access list policy match.
<b>app-route-policy</b>	Configures centralized application route policy.
<b>data-policy</b>	Configures centralized data policy.

Commands	Description
<b>sequence</b>	Configures the sequence number for a match-action pair in an access control list.

## match as-path

To match a Border Gateway Protocol (BGP) autonomous system (AS) path access list, use the **match as-path** command. To remove a path list entry, use the **no** form of this command.

**match as-path** *name*

**no match as-path** *name*

### Syntax Description

<i>name</i>	Autonomous system path access list. You can configure up to 32 access list names.
-------------	---

### Command Default

No path lists are defined.

### Command Modes

Route-map configuration mode (config-route-map)

### Command History

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

### Usage Guidelines

The values set by the **match as-path** command overrides global values.

A route map can have several parts. Any route that does not match at least one **match** clause relating to a **route-map** command is ignored; that is, the route is not advertised for outbound route maps and is not accepted for inbound route maps. If you want to modify some particular data, you must configure a second route-map section with an explicit match specified.

### Examples

This example sets the autonomous system path to match BGP autonomous system path access list:

```
Device(config)# route-map rmap1 permit 10
Device(config-route-map)# match as-path 120
```

## match (data policy)

To configure matching attributes in a data policy, use the **match** command in data policy sequence configuration mode. To remove match parameters, use the **no** form of this command.

```
match [ app-list app-list-name | destination-data-ipv6-prefix-list ipv6-prefix-list-name |
destination-data-prefix-list ipv4-prefix-list-name | destination-ip ip/length | destination-port number
| destination-tag-instance dest-tag-name | dscp number | packet-length number | plp { high | low
} | protocol number | source-data-prefix-list list-name | source-ip ip/length | source-port number
| source-tag-instance src-tag-name | tag-instance tag-name | tcp syn ]
```

```
no match [ app-list app-list-name | destination-data-ipv6-prefix-list ipv6-prefix-list-name |
destination-data-prefix-list list-name | destination-ip ip/length | destination-port number |
destination-tag-instance dest-tag-name | dscp number | packet-length number | plp { high | low
} | protocol number | source-data-prefix-list list-name | source-ip ip/length | source-port number
| source-tag-instance src-tag-name | tag-instance tag-name | tcp syn ]
```

Syntax Description		
<b>app-list</b> <i>app-list-name</i>	(Optional) Matches the specified application list name. The application list name character range is from 1 to 32.	
<b>destination-data-ipv6-prefix-list</b> <i>ipv6-prefix-list-name</i>	(Optional) Matches the specified destination ipv6 prefix list name. The destination ipv6 prefix list name character range is from 1 to 32.	
<b>destination-data-prefix-list</b> <i>ipv4-prefix-list-name</i>	(Optional) Matches the specified destination prefix list name. The destination ipv4 prefix list name character range is from 1 to 32.	
<b>destination-ip</b> <i>ipv4 prefix (ip/length)</i>	(Optional) Matches the specified destination IP.	
<b>destination-port</b> <i>number</i>	(Optional) Matches the specified destination port number. Specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]). Range: 0 to 65535	
<b>dscp</b> <i>number</i>	(Optional) Matches the specified DSCP. The range is from 0 to 63.	
<b>packet-length</b> <i>number</i>	(Optional) Matches the specified packet length. The range is from 0 to 65535. You can enter a range of values.	
<b>plp</b> { <b>high</b>   <b>low</b> }	(Optional) Matches the specified packet's loss priority (PLP).	
<b>protocol</b> <i>number</i>	(Optional) Matches the TCP or IP protocol number. The range is from 0 to 255.	
<b>source-data-prefix-list</b> <i>list-name</i>	(Optional) Matches the specified source prefix list name.	
<b>source-ip</b> <i>IP/length</i>	(Optional) Matches the specified source IP.	
<b>source-port</b> <i>number</i>	(Optional) Matches the specified source port number. Specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).	
<b>tcpsyn</b>	(Optional) Matches the TCP SYN flag.	
<b>traffic-to</b>	(Optional) Matches the specified traffic-to service or access or core.	
<b>source-tag-instance</b> <i>src-tag-name</i>	(Optional) Matches the specified source tag instance name. The character range is from 1 to 127.	
<b>destination-tag-instance</b> <i>dest-tag-name</i>	(Optional) Matches the specified destination tag instance name. The character range is from 1 to 127.	

---

**tag-instance** *tag-name* (Optional) Matches the specified tag instance name. The character range is from 1 to 127.

---

**Command Default** No match criterion is specified.

**Command Modes** Data policy sequence configuration (config-sequence)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.9.1a	This command was introduced.

**Usage Guidelines** When a packet matches one of the match conditions, the defined action is taken. Or if no match occurs, the default action is taken.

The **match** command can be used to enter the match configuration mode or to define match parameters.

### Examples

The following example shows how to configure centralized data policy to include tags in matching attributes:

```
vSmart(config)# policy
vSmart(config-policy)# data-policy DP1
vSmart(config-data-policy-DP1)# vpn-list vpn1
vSmart(config-vpn-list-vpn1)# sequence 100
vSmart(config-sequence-100)# match
vSmart(config-match)# tag-instance orange
vSmart(config-match)# source-tag-instance red
vSmart(config-match)# destination-tag-instance blue
vSmart(config-match)# action accept
vSmart(config-action)# count count1
```

**Table 5: Related Commands**

Commands	Description
<b>action</b>	Specifies action for matched parameters.
<b>sequence</b>	To configure the sequence number for a match-action pair in an access control list.
<b>access-list</b>	To configure localized access list policy match.
<b>match (access-control-list)</b>	To configure match attributes in an access list policy.

## match ip address

To distribute any routes that have a destination IP network number address that is permitted by a standard access list, an expanded access list, or a prefix list, use the **match ip address** command. To remove the **match ip address** entry, use the **no** form of this command.

```
match ip address { prefix-list [ [ prefix-list-name ] ] }
```

**no match ip address** { **prefix-list** | [ *prefix-list-name* ] }

**Syntax Description**

<b>prefix-list</b> <i>prefix-list-name</i>	Distributes routes based on a prefix list. The prefix list name can be any alphanumeric string up to 63 characters. The ellipsis indicates that multiple values can be entered, up to 32 prefix lists.
--	--

**Command Default**

No prefix lists are specified.

**Command Modes**

Route-map configuration mode (config-route-map)

**Command History**

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

**Examples**

This example shows how to match routes that have addresses specified by an access list test:

```
Device(config)# route-map rmap1 deny 10
Device(config-route-map)# match ip address prefix-list prfx1
```

## match protocol attribute application-group

To configure the match criterion for a class map based on the specified application group, use the **match protocol attribute application-group** command in class-map configuration mode. To remove the application-group match criterion from the class map, use the **no** form of this command.

**Supported Parameters**

<i>application-group</i>	Name of the application group as a matching criterion. See the "Usage Guidelines" section for a list of application groups supported by most routers.
<i>application-name</i>	(Optional) Name of the application. When the application name is specified, the application is configured as the match criterion instead of the application group.

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see the Cisco IOS XE [match protocol attribute application-group](#) command.

**Examples**

```
class-map match-any ART_APPLICATIONS
 match protocol attribute application-group ms-cloud-group
```

## parameter-map type inspect

To configure an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action, use the **parameter-map type inspect** command in global configuration mode. To delete an inspect-type parameter map, use the **no** form of this command.

Syntax Description		
	<i>parameter-map-name</i>	Name of the inspect parameter map.
	<b>global</b>	Defines a global inspect parameter map.
	<b>default</b>	Defines a default inspect parameter map.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines** For more information about this command, see the Cisco IOS XE [parameter-map type inspect](#) command.

### Examples

The following example shows the inspect type parameter map configuration:

```
Device(config)# parameter-map type inspect parameter-map type inspect aip
Device(config)# parameter-map type inspect parameter-map type global
```

## policer

To define a policer profile and to enter the policer configuration mode, use the **policer** command in policy configuration mode. To remove the policer profile, use the **no** form of this command.

```
policer policer-name
no policer policer-name
```

Syntax Description		
	<i>policer-name</i>	Name of policer.

**Command Default** None

**Command Modes** Policy configuration (config-policy)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines**

To configure policing parameters, create a policer that specifies the maximum bandwidth and burst rate for traffic on an interface, and how to handle traffic that exceeds these values.

This command can be used to define a policer profile and enter the policer configuration mode where further configurations can be done.

**Example**

The following example defines a policer profile named `pol1`. It sets the rate to 500,000,000 bps, and burst size to 15,000 bytes, and configures to drop the traffic if the burst size or traffic rate is exceeded.

```
Device(config)# policy
Device(config-policy)# policer pol1
Device(config-policy-pol1)# rate 500000000
Device(config-policy-pol1)# burst 15000
Device(config-policy-pol1)# exceed drop
```

The following example applies a policer using an Access List named `ACL-TEST-1`.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 1
Device(config-sequence-1)# action drop
Device(config-action)# policer pol1
```

**Note** Rate, burst, and exceed must be defined before committing, otherwise the commit is aborted.

*Table 6: Related Commands*

Commands	Description
<b>burst</b>	Maximum traffic burst size, in bytes. The range is from 15000 to 10000000.
<b>exceed</b>	Action to take when the burst size or traffic rate is exceeded.
<b>rate</b>	Bandwidth for 1G interfaces, the range is from 8 to 1000000000 bps; for 10G interfaces, the range is from 8 to 10000000000 bps.

# policy

To enter policy configuration mode or configure policies, use the **policy** command in global configuration mode. To remove policy configurations, use the **no** form of this command.

```
policy [ access-list | app-visibility | class-map | cloud-qos-service-side | flow-visibility |
flow-stickness-disable | implicit-acl-logging | ipv6 | lists | log-frequency | mirror | policer |
qos-map | qos-scheduler | rewrite-rule | route-policy | utd-tls-decrypt ]
```

**no policy** [ **access-list** | **app-visibility** | **class-map** | **cloud-qos-service-side** | **flow-visibility** | **implicit-acl-logging** | **ipv6** | **lists** | **log-frequency** | **mirror** | **policer** | **qos-map** | **qos-scheduler** | **rewrite-rule** | **route-policy** | **utd-tls-decrypt** ]

Syntax Description	
<b>access-list</b>	(Optional) Configures ACLs.
<b>app-visibility</b>	(Optional) Enables/disables application visibility.
<b>class-map</b>	(Optional) Configures class map.
<b>cloud-qos</b>	(Optional) Enables/Disables QoS for cEdge Cloud.
<b>cloud-qos-service-side</b>	(Optional) Enables/Disables QoS for cEdge Cloud on service side.
<b>flow-visibility</b>	(Optional) Enables/Disables flow visibility.
<b>flow-stickness-disable</b>	(Optional) Enables/Disables flow stickiness.
<b>implicit-acl-logging</b>	(Optional) Enables/Disables logging of implicit acl packet drops.
<b>ipv6</b>	(Optional) Configures IPv6 policy.
<b>lists</b>	(Optional) Configures lists.
<b>log-frequency</b>	(Optional) Logs frequency as packet counts.
<b>mirror</b>	(Optional) Configures traffic mirror.
<b>policer</b>	(Optional) Configures policer.
<b>qos-map</b>	(Optional) Configures QoS map.
<b>qos-scheduler</b>	(Optional) Configures QoS scheduler.
<b>rewrite-rule</b>	(Optional) Configures rewrite rule.
<b>route-policy</b>	(Optional) Configures route policies
<b>utd-tls-decrypt</b>	(Optional) Configures TLS Decryption policies.

**Command Default** Default behavior or values vary based on optional arguments or keywords.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.
	Cisco IOS XE Release 17.6.1a	The <b>flow-stickness-disable</b> keyword is added.
	Cisco IOS XE Catalyst SD-WAN Release 17.13.1a	The <b>flow-stickness-disable</b> keyword is added for NAT66 DIA.

**Usage Guidelines**

Policy influences the flow of data traffic and routing information among Cisco devices in the overlay network. This command can be used to enter the policy configuration mode where further configurations can be done or to configure policies with optional arguments or keywords.

**Example**

The following example enters the policy configuration mode. It defines a policer profile named `pol1` and sets the burst size to 15,000 bytes, and rate to 500,000,000 bps, and configures to drop the traffic if the burst size or traffic rate is exceeded.

```
Device(config)# policy
Device(config-policy)# policer pol1
Device(config-policy-poll)# burst 15000
Device(config-policy-poll)# rate 500000000
Device(config-policy-poll)# exceed drop
Device(config-policy-poll)# flow-stickness disable
```

The following example enables app-visibility.

```
Device(config)# policy app-visibility
```

The following example disables flow-stickness.

```
Device(config-policy)# flow-stickness disable
```

## policy ip visibility

To manually enable or disable policy feature fields visibility, use the **ip visibility** command in policy configuration mode. To disable the feature fields visibility, use the **no** form of the command.

```
ip visibility features [ cxp | dre | fec | multi-sn | pktdup | probe-saas | sslproxy | ulogging ] { enable | disable }
```

```
no ip visibility features [ cxp | dre | fec | multi-sn | pktdup | probe-saas | sslproxy | ulogging ] { enable | disable }
```

**Syntax Description**

<b>cxp</b>	cloud express feature
<b>dre</b>	APPQOE DRE feature.
<b>fec</b>	FEC feature
<b>multi-sn</b>	APPQOE Multi SN feature
<b>pktdup</b>	Packet duplicate feature
<b>probe-saas</b>	Probe saas feature
<b>sslproxy</b>	SSLProxy feature
<b>ulogging</b>	Unified logging feature

**Command Default**

Default behavior or values vary based on optional arguments or keywords.

**Command Modes** Policy configuration mode (config-policy)

Command History	Release	Modification
	Cisco IOS XE Release 17.9.1a	This command was introduced.

**Usage Guidelines** Starting from Cisco IOS XE Release 17.9.1a, you can manually enable or disable the feature fields visibility. Even if the feature fields are enabled automatically due to upgrade, you need to disable fields manually using **ip visibility features *features*disable** command or use the **no** form of the command.

The disable behavior is same as **no policy ip visibility features**.

The following example shows how to enable the cpx feature fields using the **ip visibility** command:

```
Device(config)# policy ip visibility features cpx enable
```

The following shows how to diable the cpx feature using the **no** form or **disable** command:

```
Device(config)# no policy ip visibility features cpx
```

```
Device(config)# policy ip visibility features cpx disable
```

## policy log-rate-limit

To limit the number of policy flow logs in a given second, use the **policy log-rate-limit** command in global configuration mode . To disable the limit, use the **no** form of this command.

### policy log-rate-limit

This command has no keywords or arguments.

**Command Default** The default is 25 messages logged per second.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Release 17.11.1a	This command was introduced.

**Usage Guidelines** The log-rate-limit range is 1 to 10000. For Cisco IOS XE Release 17.11.1a, a maximum rate limit supported is 500.

### Example

The following is an example of this command:

```
Device(config)# policy log-rate-limit
```

```
(<1..10000> logs per second. Default is 25) (25):
```

The following example shows how to specify a rate limit:

```
Device# show sdwan running-config policy
policy
no app-visibility
no app-visibility-ipv6
no flow-visibility
no flow-visibility-ipv6
no implicit-acl-logging
log-frequency      1000
log-rate-limit     25
access-list ACL1
  sequence 1
  match
    dscp 10
  !
  action accept
  count CNT2
  log
  !
!
default-action drop
!
```

## queue-limit

To specify or modify the maximum number of packets the queue can hold for a class configured in a policy-map, use the **queue-limit** command in policy-map class configuration mode. To remove the queue packet limit from a class, use the **no** form of this command.

```
queue-limit { queue-limit-size { bytes | ms | packets | us } dscp dscp-value }
```

```
no queue-limit { queue-limit-size { bytes | ms | packets | us } dscp dscp-value }
```

### Syntax Description

<i>queue-limit-size</i>	The maximum size of the queue. Valid range is a number from 1 to 8192000. The maximum varies according to the optional unit of measure keyword specified (bytes, ms, packets, or us).
<b>bytes</b>	(Optional) Indicates that the unit of measure is bytes. Valid range for bytes is a number from 1 to 64000000.
<b>ms</b>	(Optional) Indicates that the unit of measure is milliseconds. Valid range for milliseconds is a number from 1 to 3400.
<b>packets</b>	(Optional) Indicates that the unit of measure is packets. Valid range for packets is a number from 1 to 8192000.
<b>us</b>	(Optional) Indicates that the unit of measure is microseconds. Valid range for microseconds is a number from 1 to 512000.

---

**dscp** *dscp-value* (Optional) Specify the dscp value. Valid options are 0-63, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cs1, cs2, cs3, cs4, cs5, vs6, cs7, default, dscp, ef, precedence.

---

**Command Default** None

**Command Modes** Policy-map class configuration (config-pmap-c)

**Command History**

Release	Modification
	Qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

Weighted fair queuing (WFQ) creates a queue for every class for which a class map is defined. Packets satisfying the match criteria for a class accumulate in the queue reserved for the class until they are sent, which occurs when the queue is serviced by the fair queuing process. When the maximum packet threshold you defined for the class is reached, queuing of any further packets to the class queue causes tail drop.

You use queue limits to configure Weighted Tail Drop (WTD). WTD ensures the configuration of more than one threshold per queue. Each class of service is dropped at a different threshold value to provide for QoS differentiation.

You can configure the maximum queue thresholds for the different subclasses of traffic.

This command can be used to specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map.

**Example**

The following example shows defining the maximum queue limit to 108 packets.

```
Router(config)# policy-map POL123
Router(config-pmap)# class CLASS123
Router(config-pmap-c)# bandwidth 1000
Router(config-pmap-c)# queue-limit 108 packets
```

## rate

To define the traffic rate for a policer profile, use the **rate** command in policer configuration mode.

**rate** *bps*

---

**Note** Rate is a required parameter in a policer profile. Entering **no rate** *bps* is valid, but causes **commit** to fail.

---

**Syntax Description**

*bps* Bandwidth for 1G interfaces, the range is from 8 to 1000000000 bps; for 10G interfaces, the range is from 8 to 10000000000 bps.

---

**Command Default** None

**Command Modes** Policer configuration (config-policer-*{policer-profile-name}*)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines** To configure policing parameters, create a policer that specifies the maximum bandwidth and burst rate for traffic on an interface, and how to handle traffic that exceeds these values.

This command can be used to define the traffic rate for a policer profile.

### Example

The following example defines a policer profile named `pol1`. It sets the rate to 500,000,000 bps, and burst size to 15,000 bytes, and configures to drop the traffic if the burst size or traffic rate is exceeded.

```
Device(config)# policy
Device(config-policy)# policer pol1
Device(config-policy-pol1)# rate 500000000
Device(config-policy-pol1)# burst 15000
Device(config-policy-pol1)# exceed drop
```

The following example applies a policer using an Access List named `ACL-TEST-1`.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 1
Device(config-sequence-1)# action drop
Device(config-action)# policer pol1
```

**Note** Rate, burst, and exceed must be defined before committing, otherwise the commit is aborted.

*Table 7: Related Commands*

Commands	Description
<b>burst</b>	Maximum traffic burst size, in bytes. The range is from 15000 to 10000000.
<b>exceed</b>	Action to take when the burst size or traffic rate is exceeded.

## request-data-size

To set the protocol data size in the payload of a Cisco IOS IP Service Level Agreements (SLAs) operation's request packet, use the **request-data-size** command in the appropriate submode of IP SLA configuration, auto

IP SLA MPLS configuration, IP SLA monitor configuration, or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

**Syntax Description**

<i>bytes</i>	Size of the protocol data in the payload of the request packet of the operation, in bytes. Range is from 0 to the maximum supported by the protocol.
--------------	--

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see the Cisco IOS XE [request-data-size](#) command.

**IP SLA Configuration**

```
ip sla 6001
  udp-jitter 172.31.11.85 44444 source-ip 172.31.17.220 num-packets 100
  request-data-size 64
  tag 6001:UDP64 HNZ-H7Z
  frequency 300
```

## rewrite-rule

To configure a rewrite rule to overwrite the DSCP field of a packet's outer IP header, mark transit traffic with an 802.1p CoS value, and apply a rewrite rule on an interface use the **rewrite-rule** command. A rewrite rule is applied to packets that are transmitted out of the interface.

You can apply rewrite rules to both unicast and multicast traffic.

**rewrite-rule** *rule-name* [ **class** *class-name* ] { **high** | **low** } **dscp** *dscp-value* **mpls-exp-topmost** *mpls-exp-value*

**no rewrite-rule** *rule-name* [ **class** *class-name* ] { **high** | **low** } **dscp** *dscp-value* **mpls-exp-topmost** *mpls-exp-value*

**Syntax Description**

<b>dscp</b> <i>dscp-value</i>	DSCP value: Assign a DSCP value to transit traffic. Range: 0 through 63
-------------------------------	---

<b>mpls-exp-topmost</b> <i>mpls-exp-value</i>	Multiprotocol label switching experimental field (MPLS EXP) value: Assign an MPLS EXP value to traffic.  <b>Note</b> If you use the <b>dscp</b> keyword to assign a DSCP value to traffic that uses MPLS, the command maps the DSCP value to an MPLS EXP value using the standard mapping of DSCP to MPLS EXP. For information about this mapping, see the <a href="#">QoS: Classification Configuration Guide, Cisco IOS XE 17</a> .  Range: 0 through 7
<b>class</b> <i>class-name</i>	Forwarding class name: Name of the forwarding class.
<i>rule-name</i>	Rewrite rule name:  Name of the rewrite rule. It can be a text string from 1 through 32 characters long. When you apply a rewrite rule to an interface, the name must match one that you specified when you created the rule with the <b>policy rewrite-rule</b> configuration command.

**Note** Cisco IOS XE SD-WAN supports a maximum number of only 16 rewrite rules and only 64 entries per rewrite rule.

#### Command Default

None.

#### Command Modes

Policy configuration (config-policy)

#### Command History

Release	Modification
Cisco IOS XE Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.
Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Added the <b>mpls-exp-topmost</b> keyword.

#### Usage Guidelines

For traffic using IP, the **rewrite-rule** command assigns a value to the DSCP field of the IP header for outgoing traffic.

In carrier supporting carrier (CSC) scenarios, which use MPLS, the **rewrite-rule** command assigns the MPLS EXP value in the MPLS header for outgoing traffic. Use the **rewrite-rule** command using a CLI template or CLI add-on template, and the **mpls-exp-topmost** keyword. If, in a CSC scenario, you use the **dscp** keyword instead, such as with legacy configurations created before support of the **mpls-exp-topmost** keyword, the **rewrite-rule** command converts the DSCP value to an MPLS EXP value in accordance with the standard mapping of DSCP to MPLS EXP values. The benefit of using the **mpls-exp-topmost** keyword is that you can set the MPLS EXP value directly, without depending on the mapping of DSCP to MPLS EXP values.

The following example shows how to create a rewrite rule:

```
Device(config)# policy
Device(config-policy)# rewrite-rule Branch-QoS-Rewrite-Template
Device(config-policy)# class BULK low dscp 10
Device(config-policy)# class BULK high dscp 10
```

The following example applies to a CSC scenario. It defines a rewrite rule called `rw-exp`, which sets the MPLS EXP value for outgoing traffic to 1 and applies the rule to the outbound interface.

Define the rewrite rule using the **mpls-exp-topmost** keyword, as follows:

```
sdwan
 policy
  rewrite-rule rw-exp
    class BULK low mpls-exp-topmost 1
    class BULK high mpls-exp-topmost 1
```

Alternatively, if you define the rewrite rule using the **dscp** keyword, the **rewrite-rule** command converts the value of 10 to an MPLS EXP value of 1, in accordance with the standard mapping of DSCP to MPLS EXP values.

```
sdwan
 policy
  rewrite-rule rw-exp
    class BULK low dscp 10
    class BULK high dscp 10
```

Apply the rule as follows:

```
sdwan
interface GigabitEthernet0/0/2
 tunnel-interface
  encapsulation ipsec weight 1
  no border
  color public-internet restrict
 exit
 rewrite-rule rw-exp
 exit
```

## service-area

To classify traffic based on service areas for different Microsoft 365 (M365) cloud services, use the **service-area** command in Policy configuration (`config-policy`) mode.

**service-area** *service-area-name*

**no service-area** *service-area-name*

**Syntax Description**

*service-area name* Specifies one or more service-areas that the M365 cloud application belongs to.

The four service areas are:

- **Common:** M365 Pro Plus, Office in a browser, Azure AD, and other common network endpoints.
- **Exchange:** Exchange Online and Exchange Online Protection.
- **SharePoint:** SharePoint Online and OneDrive for Business.
- **Skype:** Skype for Business and Microsoft Teams.

**Command Default**

There are no default values.

**Command Modes**

Policy configuration (config-policy)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

- SD-AVC must be enabled on Cisco vManage.
- You can add only one sequence with a match for a service-area, to a policy configuration in Cisco vManage.

The following example shows how to specify a service area:

```

policy
app-route-policy test_policy
vpn-list vpn-list-1
sequence 111
match
source-ip 0.0.0.0/0
service-area exchange sharepoint skype
traffic-category optimize-allow
!
action
count count-name
cloud-saas
!
!
!
```

## service-policy

To attach a policy map to an input interface, a virtual circuit (VC), an output interface, or a VC that will be used as the service policy for the interface or VC, use the **service-policy** command in the appropriate configuration mode. To remove a service policy from an input or output interface or from an input or output VC, use the **no** form of this command.

**Supported Parameters**

<b>type</b>	(Optional) Determines the exact pattern to look for in the protocol stack of interest.
<b>input</b>	Attaches the specified policy map to the input interface or input VC.
<i>policy-map-name</i>	The name of a service policy map (created using the <b>policy-map</b> command) to be attached. The name can be a maximum of 40 alphanumeric characters in length.

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For usage guidelines, see the Cisco IOS XE [service-policy](#) command.

**Examples**

```
interface GigabitEthernet0/0/1
 service-policy type ebr input test300
interface GigabitEthernet0/0/2
 service-policy type ebr input test100
```

# set ip vrf

To indicate where to forward packets that pass a match clause of a route map for policy routing when the next hop must be under a specified virtual routing and forwarding (VRF) name, use the **setipvrf** command in policy map class configuration mode. To disable this feature, use the **no** form of this command.

**Supported Parameters**

<i>vrf-name</i>	Name of the VRF.
<b>next - hop</b> <i>ip-address</i>	IP address of the next hop to which packets are forwarded. The next hop must be an adjacent router.

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For usage guidelines, see the Cisco IOS XE [set ip vrf](#) command.

**Examples**

```
ip access-list extended test300
 100 permit ip any 0.0.0.2 255.255.255.0
ip access-list extended test100
 100 permit ip any 0.0.0.2 255.255.255.0
class-map match-any test300
 match access-group name test300
```

```

class-map match-any test100
  match access-group name test100
policy-map type ebr test300
  class test300
    set ipv4 vrf 300 next-hop 203.0.113.255
policy-map type ebr test100
  class test100
    set ipv4 vrf 100 next-hop 203.0.113.255
interface GigabitEthernet0/0/1
  service-policy type ebr input test300
interface GigabitEthernet0/0/2
  service-policy type ebr input test100

ipv6 access-list test300_v6
  sequence 100 permit ipv6 any 2003::2/64
ipv6 access-list test100_v6
  sequence 100 permit ipv6 any 2001::2/64
class-map match-any test300_v6
  match access-group name test300_v6
class-map match-any test100_v6
  match access-group name test100_v6
policy-map type ebr test300_v6
  class test300_v6
    set ipv6 vrf 300 next-hop 2003::2
policy-map type ebr test100_v6
  class test100_v6
    set ipv6 vrf 100 next-hop 2001::2
interface GigabitEthernet0/0/1
  service-policy type ebr input test300_v6
interface GigabitEthernet0/0/2
  service-policy type ebr input test100_v6

```

## set ip next-hop verify-availability

To configure policy routing to verify the reachability of a single or multiple IPv4 or IPv6 next hops of a policy map before the router performs policy routing to the next hops, use the **set ipv4 next-hop verify-availability** or **set ipv6 next-hop verify-availability** commands respectively in the policy-map class mode.

To disable this feature, use the **no** form of this command

```

set [ ipv4 | ipv6 ] [ vrf vrf-name | global ] next-hop verify-availability [ ip-address ... [ ip-address ] ]
[ nhop-address sequence track object-number ]
no [ ipv4 | ipv6 ] [ vrf vrf-name | global ] next-hop verify-availability [ ip-address ... [ ip-address ] ]
[ nhop-address sequence track object-number ]

```

### Syntax Description

<b>vrf</b> <i>vrf-name</i>	Specifies that the next hop reachability should be verified for a specific VRF.
<b>global</b>	Specifies that the next hop reachability should be verified at a global level
<i>ip-addresses</i>	Specifies a single or multiple next hops addresses to verify their reachability
<i>nhop-address</i>	Specifies a single next hop address to verify its reachability
<i>sequence</i>	Specifies the sequence to be inserted into the next-hop list. The range is from 1 to 65535.
<b>track</b>	Sets the next hop depending on the state of a tracked object.

---

*object-number* Specifies tracked object number. The range is from 1 to 1000.

---

**Command Default**

This command is disabled by default.

**Command Modes**

Policy-map class configuration (config-pmap-c)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command was introduced.

**Usage Guidelines**

Use this command to enable policy routing to verify the reachability of a single or multiple IPv4 or IPv6 next hop addresses. This command can be configured globally or for a vrf. The options after **set [ipv4|ipv6] next-hop verify-availability** can be configured in any order.

An ellipsis (...) in the command syntax indicates that your command input can include multiple values for the ip-address argument

**Example**

The following example shows how to verify the availability of an IPv4 next hop address, and enable tracker for the address.

```
Device(config)# class-map match-any test100
Device(config-cmap)# match access-group name test100
Device(config-cmap)# policy-map type epbr 1
Device(config-pmap)# class test300
Device(config-pmap-c)# set ipv4 vrf 300 next-hop verify-availability 10.10.0.2 10 track 2
```

The following example shows how to verify the availability of an IPv6 next hop address and enable tracker for the address.

```
Device(config)# class-map match-any test100_v6
Device(config-cmap)# match access-group name test100_v6
Device(config-cmap)# policy-map type epbr test300_v6
Device(config-pmap)# class test300_v6
Device(config-pmap-c)# set ipv6 vrf 300 next-hop verify-availability 2001:DB8::1 10 track 4
```

## sequence

To specify a sequence number for the permit condition in the IP access list, use the **sequence** command in the appropriate configuration mode. To remove a sequence number from an IP access list, use the **no** form of this command.

```
sequence sequence-number { permit } { ipv6 } { any ipv6-address }
```

**Syntax Description**

<i>sequence-number</i>	Permits statements to position the statement in the list.
<b>permit</b>	Sets permit conditions for an IPv6 access list.
<b>ipv6</b>	Sets the IPv6 address to set permit conditions.
<b>any</b> <i>ipv6-address</i>	Specifies any source or any destination host as an abbreviation for the <i>source-addr</i> or <i>destination-addr value</i> and the <i>source-wildcard</i> or <i>destination-wildcard</i> value of 0.0.0.255.255.255.255.

**Command Default**

There are no specific conditions under which a packet passes the access list.

**Command Modes**

IPv6 access-list configuration

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Examples**

```
Device(config)# ipv6 access-list test300_v6
Device(config-ipv6-acl)# sequence 100 permit ipv6 any 2001:DB8::/32
```

## sequence (access-control-list)

To define the sequence number for a match-action pair in an access control list, use the **sequence** command in access control list configuration mode. To remove the sequence number and match-action pair, use the **no** form of this command.

```
sequence number
no sequence number
```

**Syntax Description**

*number* Sequence number ranging from 0 to 65535.

**Command Default**

None

**Command Modes**

Access Control List configuration (config-access-list-*{ACL-name}*)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

**Usage Guidelines**

Access control lists (ACLs) perform packet filtering to control which packets move through an interface of a router. The packet filtering provides security by helping to limit the network traffic, restrict the access of

users and devices to a network, and prevent the traffic from leaving a network interface. An access control list is a sequential list consisting of match-action pairs.

The sequence numbering feature applies sequence numbers to match-action pairs. The match-action pairs are evaluated in order, by sequence number, starting with the lowest numbered pair and ending when it matches the conditions in one of the pairs.

When a packet matches one of the match conditions, the defined action is taken. Or if no match occurs, the default action is taken.

This command can be used to define the sequence number for a match-action pair in an access control list.

### Example

The following example creates an access control list named ACL-TEST-1, defines sequence #10, specifies destination IP 10.10.10.10/32 as a match parameter and defines the action to drop when matched.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# sequence 10
Device(config-sequence-10)# match destination-ip 10.10.10.10/32
Device(config-match)# exit
Device(config-sequence-10)# action drop
```

The following example creates an access control list named ACL-TEST-1 and removes sequence #10 and the match-action pair.

```
Device(config)# policy
Device(config-policy)# access-list ACL-TEST-1
Device(config-access-list-ACL-TEST-1)# no sequence 10
```

**Table 8: Related Commands**

Commands	Description
<b>default-action</b>	Specifies default action for matched parameters.

## sla-class

To configure a Service Level Agreements (SLA) class, use the **sla-class** command in global configuration mode. You can create groups of properties for a policy to use with application-aware routing. You can configure a maximum of six SLA classes for Cisco IOS XE SD-WANs.

```
sla-class sla-class-name jitter jitter latency latency loss percentage app-probe-class
app-probe-class-name [ fallback-to-best-tunnel criteria criteria jitter jitter latency latency loss
percentage ]
```

```
no sla-class sla-class-name
```

### Syntax Description

<b>jitter</b> <i>milliseconds</i>	Specifies the jitter on the connection. Packets matching the policy for application-aware routing that have the specified jitter or a lower jitter value.  <i>Range:</i> 1 through 1000 milliseconds
-----------------------------------	--

<b>latency</b> <i>milliseconds</i>	Specifies the latency on the connection. Packets matching the policy for application-aware routing that have the specified latency or a lower latency value.  <i>Range:</i> 1 through 1000 milliseconds
<b>loss</b> <i>percentage</i>	Specifies the packet loss on the connection. Packets matching the policy for application-aware routing that have the specified packet loss or a lower packet loss value.  <i>Range:</i> 0 through 100 percentage
<b>app-probe-class</b> <i>app-probe-class-name</i>	Specifies the app-probe-class configured on the SLA class.
(Optional) <b>fallback-to-best-tunnel</b>	(Optional) Specifies the fallback-to best-tunnel option. When this option is selected, the packet can choose the best path available using the criteria.
<b>criteria</b>	Specifies the criteria. The options are a combination of one or more of loss, latency, and jitter values.

**Command Default**

There are no default values.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.  A app-probe-class keyword is added.
Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	A fallback-best-tunnel and criteria keywords are added.

The following example shows the SLA configuration for a latency of 50 millisecond and a app-probe-class along with the fallback-best-tunnel option:

```
Device(config)# policy
Device(config-policy)# sla-class 50ms-sla
Device(config-policy)# latency 50
Device(config-policy)# app-probe-class real-time-video
Device(config-policy)# fallback-best-tunnel
Device(config-policy)# criteria loss jitter
```

**sig**

To enable VPN multiplexing and demultiplexing, use the **sig** command in the action configuration mode. The SIG tunnel is created in the VPN 0 (global) space. The SIG tunnel configuration is identical to other

IPSec tunnel configurations, excluding the inclusion of the **tunnel vrf multiplexing** command. To remove the multiplexing, use the **no sig** form of this command.

**sig**

**no sig**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values.

**Command Modes** action configuration (config-action)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

```
vSmart(config)# policy
vSmart(config-policy)# data-policy sig_ha_zscaler_data_policy_cedge
vSmart(config-data-policy-sig_ha_zscaler_data_policy_cedge)# vpn-list vpn_1
vSmart(config-vpn-list-vpn_1)# sequence 100
vSmart(config-sequence-100)# match destination-ip 10.10.10.10/32
vSmart(config-match)# protocol 17
vsmart(config-match)# !
vsmart(config-match)# action accept
vsmart(config-action)# count sig_ha_zscaler_datapolicycnt100
vsmart(config-action)# sig
vsmart(config-action)# exit
vsmart(config-action)# exit
```

## site-list

To list of one or more identifiers of sites in the Cisco SD-WAN overlay network, use the **site-list** command in the policy lists configuration mode. To remove the listing of sites, use the **no site-list** form of this command.

**site-list** *list-name*

**no site-list** *list-name*

**Syntax Description** *list-name* List of sites to which to apply the policy. The *list-name* must match a list name that you configured in the **policy lists site-list** part of the configuration.

**Command Default** None

**Command Modes** policy lists configuration (config-lists)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

The following example configures site lists to use for control and data policies that contain overlapping site identifiers, and apply the policies to this site lists on a Cisco vSmart Controller.

```
vSmart(config)# policy
vSmart(config-policy)# lists
vSmart(config-lists)# site-list us-control-list
vSmart(config-lists)# site-id 1-200
vSmart(config-lists)# site-list emea-control-site-list
vSmart(config-lists)# site-id 201-300
vSmart(config-lists)# site-list apac-control-site-list
vSmart(config-lists)# site-id 301-400
```

## tag (IP SLA)

To create a user-specified identifier for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **tag** (IP SLA) command in the appropriate submode of IP SLA configuration, auto IP SLA MPLS configuration, or IP SLA monitor configuration mode. To remove a tag from an operation, use the **no** form of this command.

Syntax Description	
<i>text</i>	Name of a group to which the operation belongs from 0 to 16 ASCII characters.

**Command Default** No tag identifier is specified.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines** For more information about this command, see the Cisco IOS XE [tag](#) command.

```
ip sla responder
ip sla 6001
  udp-jitter 172.31.11.85 44444 source-ip 172.31.17.220 num-packets 100
  request-data-size 64
  tag 6001:UDP64 HNZ-H7Z
  frequency 300
ip sla schedule 6001 life forever start-time now
ip sla 7001
  icmp-echo 172.31.17.222 source-ip 172.31.17.216

```

```
ip sla reaction-configuration 7001 react timeout threshold-type immediate action-type
trapAndTrigger
```

## tag-instances

To configure tag instances with member attributes, use the **tag-instances** command in global configuration mode. To delete the tag instances, use the **no** form of this command.

```
tag-instances tag-instance tag-instance-name [ app-list app-list-name ] [ data-prefix-list
data-prefix-list-name ] [ data-ipv6-prefix-list ipv6-prefix-list-name ] [ id tag-id ]
no tag-instances tag-instance tag-instance-name
```

Syntax Description	tag-instance	Specifies the tag instance information.
	<i>tag-instance-name</i>	Specifies the tag instance name.
	<i>app-list-name</i>	Specify the list of app list names of 1 to 32 characters.
	<i>data-prefix-list-name</i>	Specify the list of data prefix list names of 1 to 32 characters.
	<i>data-ipv6-prefix-list-name</i>	Specify the list of data IPv6 prefix list names of 1 to 32 characters.
	<i>tag-id</i>	Global unique ID assigned to each of the tag instances. Range: 1 to 4294967295.

**Command Default** No tag identifier is specified.

**Command Modes** Global configuration mode (config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.9.1a	This command was introduced.

**Usage Guidelines** You cannot modify the tag ID after the tag name is provided. To modify a tag ID, delete the tag and create a new tag with a new tag ID.

**Examples** The following example shows how to configure tag-instances red and blue with unique tag-ids and data-prefix-list names:

```
tag-instances
 tag-instance red
   tag-id 1000
   data-prefix-list pfx1 pfx2
!
 tag-instance blue
   tag-id 2000
   data-ipv6-prefix-list v6_pfx1 v6_pfx2
!
```

## Related Commands

Command	Description
<b>lists</b>	To create groupings of similar objects, such as IP prefixes, data-prefixes, and app-lists for use when configuring tag-instances. Note that the lists configured under tag-instances is not same as the lists configured under policy. Tag-instances requires its own lists configured.

## track ip sla

To track the state of a Cisco IOS IP Service Level Agreements (SLAs) operation and to enter tracking configuration mode, use the **trackipsla** command in global configuration mode. To remove the tracking, use the **no** form of this command.

## Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

## Usage Guidelines

For usage guidelines, see the Cisco IOS XE [track ip sla](#) command.

## Examples

The following example shows how to configure the tracking process to track the state of IP SLAs operation 2:

```
Device(config)# track 1 ip sla 2 state
Device(config-track)
```

The following example shows how to configure the tracking process to track the reachability of IP SLAs operation 3:

```
Device(config)# track 2 ip sla 3 reachability
Device(config-track)
```

## udp-jitter

To configure a Cisco IOS IP Service Level Agreements (SLAs) User Datagram Protocol (UDP) jitter operation or a IP SLAs multicast UDP jitter operation and enter UDP jitter or multicast UDP jitter configuration mode, use the **udp-jitter** command in IP SLA configuration mode.

## Syntax Description

<i>destination-ip-address</i>   <i>destination-hostname</i>	Destination IPv4 or IPv6 address or hostname. <ul style="list-style-type: none"> <li>For a multicast UDP jitter operation, this must be a multicast IP address.</li> </ul>
<i>destination-port</i>	Specifies the destination port number. The range is from 1 to 65535.

<b>source-ip</b> <i>{ip-address   hostname}</i>	(Optional) Specifies the source IPv4 or IPv6 address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
<b>num-packets</b> <i>number-of-packets</i>	(Optional) Specifies the number of packets. The default is 10.

**Command Default** No IP SLAs operation type is configured for the operation being configured.

**Command Modes** IP SLA configuration (config-ip-sla)

**Command History**

Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Command qualified for use in Cisco vManage CLI templates..
--	--

**Usage Guidelines** For more information about this command, see the Cisco IOS XE [udp-jitter](#) command.

### Examples

```
ip sla responder
ip sla 6001
  udp-jitter 172.31.11.85 44444 source-ip 172.31.17.220 num-packets 100
  request-data-size 64
  tag 6001:UDP64 HNZ-H7Z
  frequency 300
ip sla schedule 6001 life forever start-time now
ip sla 7001
  icmp-echo 172.31.17.222 source-ip 172.31.17.216
  request-data-size 64
  tag 7001:AVAILABILITY DSO-D7S
  frequency 30
ip sla schedule 7001 life forever start-time now
ip sla reaction-configuration 6001 react rtt threshold-value 40 40 threshold-type immediate
  action-type trapAndTrigger
ip sla reaction-configuration 6001 react timeout threshold-type immediate action-type
trapAndTrigger
ip sla reaction-configuration 6001 react packetLossDS threshold-value 1 1 threshold-type
immediate action-type trapAndTrigger
ip sla reaction-configuration 7001 react timeout threshold-type immediate action-type
trapAndTrigger
```

## utd-policy

To attach an Unified Threat Defense (UTD) action to a policy, use the **utd-policy** command in profile configuration mode. The UTD action contains both the UTD profile and a UTD policy that will be applied, and along with the TLS decryption action.

**utd-policy** *policy-name*

**Syntax Description**

<i>policy-name</i>	Enter a name for the UTD policy.
--------------------	----------------------------------

**Command Modes** Profile configuration (config-profile)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	Qualified for use in Cisco vManage CLI templates

The following example shows how to attach a profile for a Unified Security Policy.

```
Device(config)# parameter-map type inspect aip
Device(config-profile)# utd-policy united
```

## vpn-list

To list the VPNs on Cisco vSmart Controllers for which a policy is applicable such as, data-policy and app-route-policy, use the **vpn-list** command in data policy configuration mode. To remove the list of VPNs, use the **no** form of this command.

```
vpn-list { list-name }
```

```
no vpn-list { list-name }
```

**Syntax Description**

*list-name* Specifies the name of the policy-related list that the Cisco vSmart Controller saves on the Cisco IOS XE Catalyst SD-WAN device.

**Command Default**

None

**Command Modes**

data policy configuration (config-data-policy)

**Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

**Usage Guidelines**

For more information about this command, see [Centralized Policy](#).

```
vSmart(config)# policy
vSmart(config-policy)# data-policy sig_ha_zscaler_data_policy_cedge
vSmart(config-data-policy-sig_ha_zscaler_data_policy_cedge)# vpn-list vpn_1

```

## vrf (IP SLA)

To allow monitoring within Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs) using Cisco IOS IP Service Level Agreements (SLAs) operations, use the **vrf** command in the appropriate submode of IP SLA configuration, IP SLA monitor configuration, or IP SLA template configuration mode.

### Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command qualified for use in Cisco vManage CLI templates.

### Usage Guidelines

For usage guidelines, see the Cisco IOS XE [vrf \(IP SLA\)](#) command.

### Examples

The following examples show how to configure an IP SLAs operation for an MPLS VPN. These examples show how test traffic can be sent in an already existing VPN tunnel between two endpoints.

#### IP SLA Configuration

```

Device# config-transaction
Device(config)# ip sla 1
Device(config-ip-sla)# icmp-echo 10.1.1.1
Device(config-ip-sla-echo)# vrf vpn1
Device(config-ip-sla-echo)#

```
